Package 'FIESTA'

May 20, 2024

Type Package

Title Forest Inventory Estimation and Analysis

Version 3.6.3

Date 2024-05-20

Description A research estimation tool for analysts that work with sample-based inventory data from the U.S. Department of Agriculture, Forest Service, Forest Inventory and Analysis (FIA) Program.

Depends R (>= 4.2.0)

Imports data.table, DBI, FIESTAutils (>= 1.2.3), gdalraster, grDevices, graphics, methods, RSQLite, sf, sqldf, utils

Suggests knitr, geodata, terra, rmarkdown, testthat (>= 3.0.0)

VignetteBuilder knitr

License GPL-3

Copyright See file COPYRIGHTS for details.

R topics documented:

`FIESTA-package` *EcoMap SpatialPolygonsDataFrame*

Description

Contains regional geographic delineations for analysis of ecological relationships across ecological units. ECOMAP is the term used for a USDA Forest Service initiative to map ecological units and encourage their use in ecosystem-based approaches to forest land conservation and management. It is coordinated at the national and regional levels by USDA Forest Service staff and implemented in cooperation with State forestry agencies and others. ECOMAP mapping criteria are outlined in the National Hierarchical Framework of Ecological Units (https://www.ncrs.fs.fed.us/gla/reports/hierarchy.htm). The framework systematically divides the country into progressively smaller areas of land and water that have similar physical and biological characteristics and ecological processes.

Details

The EcoMap Provinces feature class contains ecological province polygons attributed with names and descriptions. The EcomapSections 2007 data set describes the ecological sections within the conterminous United States. The EcomapSubections 2007 data set describes the ecological subsections within the conterminous United States.

Converted to simple feature
Transformed CRS from longlat(EPSG:4269) to Albers (EPSG:5070)
Saved to R object, with compression='xz'

FIESTA - Forest Inventory Estimation for Analysis

FIESTA is a research estimation tool for analysts that work with sample-based inventory data from the U.S. Department of Agriculture, Forest Service, Forest Inventory and Analysis (FIA) Program.

FIESTA can generate FIA's traditional state-wide estimates while also accommodate: unique population boundaries, different evaluation time periods, customized stratification schemes, non-standard variance equations, integration of multi-scale remotely-sensed data and other auxiliary information, and interaction with other modeling and estimation tools from CRAN's library of packages.

FIESTA contains a collection of functions that can query FIA databases, summarize and compile plot and spatial data, and generate estimates with associated sampling errors.

`datBarplot` *Data - Generates frequency barplot.*

Description

Generate a barplot of from a frequency data frame.

Usage

```
datBarplot(
  x,
  xvar = NULL,
  yvar = "FREQ",
  grpvar = NULL,
  errbars = FALSE,
  x.order = NULL,
  sevar = NULL,
  psevar = NULL,
  device.type = "dev.new",
  jpeg.res = 300,
  device.height = 5,
  device.width = 8,
  horiz = FALSE,
  toplabelvar = NULL,
  ylim = NULL,
  divideby = NULL,
```

```
  ylabel = NULL,
  xlabel = NULL,
  mar = NULL,
  addlegend = FALSE,
  main = NULL,
  cex.main = 1,
  cex.label = 1,
  cex.names = 0.8,
  las.xnames = 0,
  las.ynames = 1,
  savedata = FALSE,
  outfolder = NULL,
  outfn = NULL,
  outfn.pre = NULL,
  outfn.date = TRUE,
  overwrite = FALSE,
  ...
)
```

Arguments

x	Data frame or comma-delimited file (*.csv) - a frequency table.
xvar	String. Name of X variable.
yvar	String. Name of the y variable (e.g., FREQ).
grpvar	String. Name of the variable for grouping.
errbars	Logical. If TRUE, error bars are added to bar plot (sevar or psevar must also be populated).
x.order	String or Vector. Define order of xvar based on y values: descending ("DESC") or ascending ("ASC") or vector of row numbers. If NULL, the order of the input table is used.
sevar	String. Name of the variable with standard error values.
psevar	String. Name of the variable with percent standard error.
device.type	String. Type(s) of device for plotting ("dev.new", "jpg", "pdf").
jpeg.res	Integer. Resolution for jpeg image.
device.height	Integer. Height (in inches) of barplot, if writing to file.
device.width	Integer. Width (in inches) of barplot, if writing to file.
horiz	Logical. If TRUE, bars are drawn horizontally with first bar at the bottom. If FALSE, bars are drawn vertically with first bar to the left (barplot parameter).
toplabelvar	String. Name of variable in x for adding labels to place above each bar (e.g., NBRPLOTS.gt0).
ylim	Number. A vector of min and max values, c(min,max) for the y axis (or x axis if horiz=TRUE). If NULL, defaults to maximum y value. If errbars=TRUE, the ylim defaults to the maximum y value plus the standard error.
divideby	String. Conversion number for output ('hundred', 'thousand', 'million').

ylabel	String. Label for the y axis (same as ylab).
xlabel	String. Label for the x axis (same as xlab).
mar	See par.. A numerical vector representing number of lines for margins (c(bottom, left, top, right).
addlegend	Logical. If TRUE, adds legend to bar plot (only applicable if grouping).
main	String. Title for plot.
cex.main	Number. Expansion factor for title.
cex.label	Number. A number representing cex in barplot (size expansion of x and/or ylabels.
cex.names	Number. Expansion factor for axis names (bar labels) (e.g., 0.5 represents half the size.
las.xnames	Number. The direction of x variable names (0,1,3). 0:diagonal (Default), 1:horizontal; 3:vertical.
las.ynames	Number. The direction of y variable names (0,1,3). 0:diagonal (Default), 1:horizontal; 3:vertical.
savedata	Logical. If TRUE, writes output data to outfolder (jpg and pdf).
outfolder	String. The name of the output folder. If savedata=TRUE, all output saved to the outfolder. If savedata=FALSE, only a text file of input parameters is saved.
outfn	String. The name of the output file if savedata=TRUE (*.csv). Do not include extension. If NULL, the file will be named BARPLOT_'yvar_date'.csv
outfn.pre	String. Add a prefix to output name (e.g., "01").
outfn.date	Logical. If TRUE, add date to end of outfile (e.g., outfn_'date'.csv).
overwrite	Logical. If TRUE and exportshp=TRUE, overwrite files in outfolder.
...	additional arguments to pass to barplot(), including a list of arguments for legend() arguments (e.g., args.legend=list(x="topleft", bty="n"), for moving legend to topleft and removing box around legend).

Details

If parameters = NULL, then it will prompt user for input.

Value

Outputs barplot to display window.

Note

If savedata = TRUE, writes a jpg and pdf of barplot to outfolder.

To add legend parameters, add a parameter named args.legend, defined as a list of specific legend parameters (see ?legend)... e.g., args.legend=list(x="topright"). If specifying x and y, x defines the lower right corner of legend box and y defines the upper right corner of box.

Author(s)

Tracey S. Frescino

Examples

```
# Set up data frame for example
ftyptab <- data.frame(cbind(FORTYPCD = c(182, 184, 201, 221, 265),
                            FREQ = c(110, 7, 900, 410, 155),
                            SE = c(10, 11, 18, 14, 22)))

# Create basic barplot
datBarplot(x = ftyptab, xvar = "FORTYPCD")

# Add standard errors to basic barplot
datBarplot(x = ftyptab, xvar = "FORTYPCD", errbars = TRUE, sevar = "SE")
```

---

datBarStacked *Data - Generates frequency barplot.*

Description

Generate a barplot of frequencies in order from most to least.

Usage

```
datBarStacked(
  x,
  main.attribute,
  sub.attribute,
  response = "phat",
  percent = FALSE,
  LUT.color = NULL,
  color = "rainbow",
  device.type = "default",
  jpeg.res = 300,
  device.width = 9,
  device.height = 6,
  mar = NULL,
  horiz = TRUE,
  bar.lim = NULL,
  bar.ratio = 1,
  ylabel = NULL,
  xlabel = NULL,
  las.xnames = NULL,
  main.order = NULL,
  sub.order = NULL,
  legend.fit = NULL,
  legend.cex = 0.8,
  legend.x = NULL,
  legend.y = NULL,
  legend.title = NULL,
```

```
  legend.bty = "o",
  legend.bg = par("bg"),
  legend.inset = 0,
  legend.xpd = par("xpd"),
  main = NULL,
  cex.main = 1,
  cex.label = 1,
  cex.names = 0.8,
  sub.add0 = FALSE,
  savedata = FALSE,
  outfolder = NULL,
  outfn = NULL,
  outfn.pre = NULL,
  outfn.date = TRUE,
  overwrite = FALSE,
  ...
)
```

Arguments

x	Data frame or comma-delimited file (*.csv) - table of values to be plotted.
main.attribute	String. The column to be used for each bar.
sub.attribute	String. The column to be used to subdivide each bar.
response	String. The column of values to be plotted. Currently defaults to "phat".
percent	Logical. If TRUE, values cover values in a stack are converted to percent of stack.
LUT.color	Data frame or comma-delimited file (*.csv) - look up table for colors. Must contain column with same name as sub.attribute.
color	String. Automated color selection ("rainbow", "topo", "heat", "terrain", "cm").
device.type	String. The type(s) of device for plotting ("default", "jpg", "pdf", or "ps").
jpeg.res	Integer. The resolution for jpeg image.
device.width	Integer. The width of output device (in inches)'
device.height	Integer. The height of output device (in inches)'
mar	See par.. A numerical vector representing number of lines for margins (c(bottom, left, top, right).
horiz	Logical. See barplot. If FALSE, the bars are drawn vertically with the first bar to the left. If TRUE, the bars are drawn horizontally with the first bar at the bottom.
bar.lim	Number vector. Equivalent to xlim or ylim, for whichever is the lengthwise axis in barcharts (ex. c(0,10)). Warning: for lower limits other than zero (ex. c(20,100), will behave strangely because par(xpd) is set to NA.
bar.ratio	Proportion of figure area taken up by barplot vs taken by legend.
ylabel	String. A label for the y axis (same as ylab).
xlabel	String. A label for the x axis (same as xlab).

las.xnames	Number. The direction of x variable names (0,1,2,3). 0:Default, parallel; 1:horizontal; 2:perpendicular; 3:vertical.
main.order	String vector. A vector of main.attribute names in desired order for bars. May also be 'DESC' or 'ASC'.
sub.order	String vector. Avector of sub.attribute names in desired order for stack, with the first name used as the column in each stack. If NULL, the order is based on the overall cover of each sub.attribute. May also be 'DESC' or 'ASC'.
legend.fit	Logical. Should bar.lim be changed to fit the legend of the plot. Will only be used if the legend is on the right side of a horizontal plot or the top of a vertical plot. (i.e. horiz=FALSE).
legend.cex	Number. Expansion factor for legend text.
legend.x	See legend. The x coordinate to be used to position the legend. If horiz=TRUE, suggested options include "topright" or "bottomright". If horiz=FALSE, suggested options include "topleft" or "topright".
legend.y	See legend. The y coordinate to be used to position the legend.
legend.title	See legend. A title for the legend.
legend.bty	See legend. the type of box to be drawn around the legend.
legend.bg	See legend. The background color for the legend box.
legend.inset	See legend. The distance from the margins as a fraction of the plot region.
legend.xpd	See legend.
main	String. Title for plot.
cex.main	Number. Expansion factor for title.
cex.label	Number. A number representing cex in barplot (size expansion of x and/or ylabels.
cex.names	Number. Expansion factor for axis names (bar labels). Ex. 0.5 represents half the size.
sub.add0	Logical. If TRUE, adds categories with 0 values to sub.attribute legend.
savedata	Logical. If TRUE, writes output data to outfolder (jpg and pdf).
outfolder	String. The name of the output folder. If savedata=TRUE, all output saved to the outfolder. If savedata=FALSE, only a text file of input parameters is saved.
outfn	String. The name of the output file if savedata=TRUE (*.csv). Do not include extension. If NULL, the file will be named BARPLOT_'yvar_date'.csv
outfn.pre	String. Add a prefix to output name (e.g., "01").
outfn.date	Logical. If TRUE, add date to end of outfile (e.g., outfn_'date'.csv).
overwrite	Logical. If TRUE and exportshp=TRUE, overwrite files in outfolder.
...	list of additional arguments to pass to barplot(); names of the list are used as argument names.

Details

Note: This function uses a customized lengthwise axis (y axis if horiz=F, x axis if horiz=T) # Therefore to modify this axis by par commands (other than the # ones specifically included above) may require changing the function. For example par(yaxp) # may not work. # # # The arguments bar.lab and bar.lim are equivalent to xlab/ylab, xlim/ylim, controlling # whichever is the lengthwise axis in the bar charts (as determined by horiz). # # # bar.ratio is only used when bar.lim is specified, it controls what percentage of the # plot area will be occupied by the specified range of the chart itself. For example, setting # bar.lim=c(0,80) and bar.ratio=0.75 will result in the 80 region, leaving 25 the bars are taller than 80 bar.lim is not specified, the function will automatically scale the lengthwise axis so # that all the bars are as tall as possible, but none of the bars over lap the legend. # # The main purpose of specifying bar.lim is if you want multiple forest types to be shown at # the same scale, sacrificing individual forest type details to make the graphs comparable # across forest types. Then you may need to fiddle with bar.ratio till the plots all look good.

Value

Outputs stacked barplot to display window.

Note

If savedata = TRUE, writes a jpg and pdf of barplot to outfolder.

`datFilter` *Data - Filters data table.*

Description

Subsets a data table by specified filter(s).

Usage

```
datFilter(
  x,
  xfilter = NULL,
  xfiltervar = NULL,
  othertabnms = NULL,
  uniqueid = "PLT_CN",
  vardelete = NULL,
  title.filter = NULL,
  savedata = FALSE,
  filternm = NULL,
  stopifnull = FALSE,
  returnDT = TRUE,
```

```
  xnm = NULL,
  savedata_opts = NULL,
  gui = FALSE
)
```

Arguments

x	Data frame, sf data frame or comma-delimited file (*.csv). A data frame to filter.
xfilter	String. A filter expression. Must be R syntax. (e.g., "STATUSCD == 1", "INVYR within double quotes (e.g., "SPP == 'Lodgepole'"). If NULL, a window pops up to select filter variable(s) and filter value(s).
xfiltervar	String. The filtervar if you know what it is. If NULL, a window will pop up to select filter value(s).
othertabnms	String vector. Name(s) of the objects or comma-delimited files to subset. Names must be in quotes (e.g., othertables=c('tree', 'cond')).
uniqueid	String. Unique identifier of x. Only needed if othertables != NULL. The uniqueid must be the same for all tables except if PLT_CN and CN.
vardelete	String vector. Vector of variables you would like deleted from filter list. Mostly used for internal queries.
title.filter	String. Title of the filter query window. Mostuly used for internal queries.
savedata	Logical. If TRUE, writes output data to outfolder.
filternm	String. Optional. Name of filter, for feedback purposes.
stopifnull	Logical. If TRUE, stop if output is NULL.
returnDT	Logical. If TRUE, returns a data table. If FALSE, returns a data frame.
xnm	String. Name for filter attribute. Used for warning messages.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'datf'.
gui	Logical. If TRUE, pop-up windows will appear for user-interface.

Details

If no parameters, then user is prompted for input. If partial parameters, default parameter values are used.

Value

A list of the following items:

xf	A data frame of filtered x.
xfilter	The xfilter.

If othertables != NULL, the other tables, named with 'in' prefix

Note

If message returned is 'filter removed all records', either the filter removed all records in x or the filter is incorrect.

Author(s)

Tracey S. Frescino

Examples

```
# Set up data for example
tab <- data.frame(cbind(CONDCLASS=c(1, 1, 2, 1, 3, 3, 3, 1, 1, 1, 2, 1),
                  FORTYPCD = c(182, 184, 201, 221, 221, 184, 221, 182,
                               182, 201, 182, 221)))

# Filter for value not equal to 182
datFilter(x = tab, xfilter = "FORTYPCD != 182")

# Filter on two conditions, grab xf object from list
datFilter(x = WYcond, xfilter = "FORTYPCD == c(221) & STDSZCD == 3")$xf
```

---

datFreq *Data - Get frequency table for specified variable(s).*

Description

Generates a frequency table from a data frame, including number of records by a specified variable or variables in the data frame with optional totals and/or subtotals.

Usage

```
datFreq(
  x,
  xvar = NULL,
  total = FALSE,
  subtotal = FALSE,
  subtotalcol = NULL,
  savedata = FALSE,
  savedata_opts = NULL,
  gui = FALSE
)
```

Arguments

x	Data frame or comma-delimited file (*.csv). The table with the variable(s).
xvar	String (vector).* The name of the variable(s) to summarize.
total	Logical. If TRUE, a row is added to bottom of table with a total for the whole table.
subtotal	Logical. If TRUE, a row is added to bottom of each section for subtotals.
subtotalcol	Logical. If subtotal=TRUE, the column(s) to generate subtotals.
savedata	Logical. If TRUE, writes output data to outfolder.

savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'datfreq'.
gui	Logical. If TRUE, pop-up windows will appear for user-interface.

Details

If no parameters, then user is prompted for input. If partial parameters, default parameter values are used.

Value

freqtable	Data frame. The frequency table.

If savedata=TRUE, a comma-delimited file of the frequency table is written to the outfolder.

Author(s)

Tracey S. Frescino

Examples

```
# Set up data for example
tab <- data.frame(cbind(CONDCLASS = c(1, 1, 2, 1, 3, 3, 3, 1, 1, 1, 2, 1),
                     FORTYPCD = c(182, 184, 201, 221, 221, 184, 221, 182,
                                  182, 201, 182, 221)))

# Frequency table with "FORTYPCD"
datFreq(x = tab,
        xvar = "FORTYPCD")

# Frequency table with "CONDCLASS" and "FORTYPCD"
datFreq(x = tab,
        xvar = c("CONDCLASS", "FORTYPCD"))

# Frequency table with "CONDCLASS" and "FORTYPCD", adding total and subtotal
# rows
datFreq(x = tab,
        xvar = c("CONDCLASS", "FORTYPCD"),
        total = TRUE,
        subtotal = TRUE)

# Frequency table for WYtree, multiple variables, subtotal options
datFreq(x = FIESTA::WYtree,
        xvar = c("SPGRPCD", "SPCD", "STATUSCD"),
       subtotal = TRUE, subtotalcol = "SPCD")
```

datLineplot *Data - Generates line graph.*

Description

Generate a line plot of multiple estimates.

Usage

```
datLineplot(
  x,
  xvar,
  yvar,
  plotCI = FALSE,
  sevar = NULL,
  CIlst = c(68, 95),
  CIcolorlst = c("dark grey", "black"),
  addshade = FALSE,
  device.type = "dev.new",
  jpeg.res = 300,
  device.height = 5,
  device.width = 8,
  ylim = NULL,
  divideby = NULL,
  ylabel = NULL,
  xlabel = NULL,
  xticks = NULL,
  mar = NULL,
  addlegend = FALSE,
  main = NULL,
  cex.main = 1,
  cex.label = 1,
  cex.names = 0.9,
  las.xnames = 0,
  las.ynames = 1,
  savedata = FALSE,
  outfolder = NULL,
  outfn = NULL,
  outfn.pre = NULL,
  outfn.date = TRUE,
  overwrite = FALSE,
  ...
)
```

Arguments

x	Data frame or comma-delimited file (*.csv) - a frequency table.

xvar	String. Name of X variable.
yvar	String. Name of the y variable (e.g., FREQ).
plotCI	Logical. If TRUE, adds confidence intervals to plot as dotted lines.
sevar	String. Name of the variable with standard error values.
CIlst	String. Numeric vector. If plotCI=TRUE, identifies percent confidence interval to add to plot.
CIcolorlst	String. Character vector. If plotCI=TRUE, identifies colors to plot confidence interval lines. Must be same length as CIlst and from colors() list.
addshade	Logical. If TRUE, adds a light grey shading between the large confidence interval lines.
device.type	String. Type(s) of device for plotting ("dev.new", "jpg", "pdf").
jpeg.res	Integer. Resolution for jpeg image.
device.height	Integer. Height (in inches) of barplot, if writing to file.
device.width	Integer. Width (in inches) of barplot, if writing to file.
ylim	Number. A vector of min and max values, c(min,max) for the y axis (or x axis if horiz=TRUE). If NULL, defaults to maximum y value. If errbars=TRUE, the ylim defaults to the maximum y value plus the standard error.
divideby	String. Conversion number for output ('hundred', 'thousand', 'million').
ylabel	String. Label for the y axis (same as ylab).
xlabel	String. Label for the x axis (same as xlab).
xticks	Numeric vector. Vector of tick marks for x axis.
mar	See par.. A numerical vector representing number of lines for margins (c(bottom, left, top, right).
addlegend	Logical. If TRUE, adds legend to bar plot (only applicable if grouping).
main	String. Title for plot.
cex.main	Number. Expansion factor for title.
cex.label	Number. A number representing cex in barplot (size expansion of x and/or ylabels.
cex.names	Number. Expansion factor for axis names (bar labels) (e.g., 0.5 represents half the size.
las.xnames	Number. The direction of x variable names (0,1,3). 0:diagonal (Default), 1:horizontal; 3:vertical.
las.ynames	Number. The direction of y variable names (0,1,3). 0:diagonal (Default), 1:horizontal; 3:vertical.
savedata	Logical. If TRUE, writes output data to outfolder (jpg and pdf).
outfolder	String. The name of the output folder. If savedata=TRUE, all output saved to the outfolder. If savedata=FALSE, only a text file of input parameters is saved.
outfn	String. The name of the output file if savedata=TRUE (*.csv). Do not include extension. If NULL, the file will be named BARPLOT_'yvar_date'.csv
outfn.pre	String. Add a prefix to output name (e.g., "01").

outfn.date	Logical. If TRUE, add date to end of outfile (e.g., outfn_'date'.csv).
overwrite	Logical. If TRUE and exportshp=TRUE, overwrite files in outfolder.
...	additional arguments to pass to barplot(), including a list of arguments for legend() arguments (e.g., args.legend=list(x="topleft", "bty="n"), for moving legend to topleft and removing box around legend).

Details

If parameters = NULL, then it will prompt user for input.

Value

Outputs barplot to display window.

Note

If savedata = TRUE, writes a jpg and pdf of barplot to outfolder.

To add legend parameters, add a parameter named args.legend, defined as a list of specific legend parameters (see ?legend)... ex. .., args.legend=list(x="topright"). If specifying x and y, x defines the lower right corner of legend box and y defines the upper right corner of box.

Author(s)

Tracey S. Frescino

Examples

```
# Lineplot of cubic foot volume by above-ground biomass, Wyoming tree data
# datLineplot(x = WYtree, xvar = "VOLCFNET", yvar = "DRYBIO_AG") # needs work
```

---

datLUTclass *Data - Create a variable with classified values.*

Description

Merge a look-up table to define categories of continuous data in x (e.g., DIA). Adds a variable to x, defining as: xvar >= MIN (and xvar < MAX).

Usage

```
datLUTclass(
  x,
  xvar = NULL,
  LUT = NULL,
  minvar = NULL,
  maxvar = NULL,
  cutbreaks = NULL,
```

```
  cutlabels = NULL,
  LUTclassnm = NULL,
  label.dec = 1,
  NAto0 = FALSE,
  vars2keep = NULL,
  keepcutbreaks = FALSE,
  dsn = NULL,
  dbconn = NULL,
  dbconnopen = FALSE,
  dbwrite = FALSE,
  dbreturn = TRUE,
  overwrite = TRUE,
  savedata = FALSE,
  savedata_opts = NULL,
  gui = FALSE
)
```

Arguments

x	Data frame or comma-delimited file (*.csv) or table in dsn. The data table with variable to classify.
xvar	String. Name of variable in the data table to join to.
LUT	Data frame or comma-delimited file (*.csv). Name of the look-up table with collapsed classes. Lookup table should include minimum values for classes, maximum values for classes, and a name of class (i.e., LUTclassnm). Maximum values and names are optional.
minvar	String. If LUT is not null, name of variable with minimimum class value (>= minvar).
maxvar	String. Optional. If LUT is not null, name of variable with maximum class value (<= maxvar).
cutbreaks	Numeric vector. Vector of numbers for minimum class values.
cutlabels	String vector. Optional. Vector of names for classes. If NULL, class names are generated from cutbreaks.
LUTclassnm	String. Optional. Name of classified variable in x. If LUT is not null and class names are included, this is the name of variable with class names. If NULL, a class names are generated from minvar or minvar and maxvar with default name equal to 'xvar'CL.
label.dec	Integer. Number of decimals to include in label.
NAto0	Logical. If TRUE, converts NA values to 0 before classification.
vars2keep	String vector. Variable names from LUT to keep (append) to x.
keepcutbreaks	Logical. If TRUE, the cutbreaks used for creating classes are appended to dataset.
dsn	String. Data source name of database with x.
dbconn	Open database connection.
dbconnopen	Logical. If TRUE, keep database connection open.

dbwrite	Logical. If TRUE, write class column to database table x.
dbreturn	Logical. If TRUE, return table with class column.
overwrite	Logical. If TRUE, and the class name already exists in x, overwrites class name.
savedata	Logical. If TRUE, saves data to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'datlutcl'.
gui	Logical. If gui, user is prompted for parameters.

Details

Use datLUTclass() to prompt for input.

Value

xLUT	Input data table with look-up table variable(s).
LUTclassnm	Name of the classified variable.
LUT	Look-up table with categories.

tablst If savedata = TRUE, a comma-delimited file is output to the outfolder as outfn. If outfn = NULL, the name of the file will be datlut_'date'.csv.

Note

The look-up table format must be similar to the following table Set LUTclassnm = VARCLNM. MAX and VALCLNM columns are optional.

MIN	MAX	VARCLNM
1.0	4.9	1
5.0	9.9	2
10.0	15.0	3
15.0	19.9	4
20.0	24.9	5
25.0	49.9	6

```

---

datLUTnm *Data - Gets variable description or class.*

Description

Merge a look-up table to append new variables, names, or categories to x.

Usage

```
datLUTnm(
  xvar,
  x = NULL,
  uniquex = NULL,
  LUT = NULL,
  LUTvar = NULL,
  LUTnewvar = NULL,
  LUTnewvarnm = NULL,
  FIAname = FALSE,
  group = FALSE,
  NAclass = "Other",
  add0 = FALSE,
  spcdname = "COMMON_SCIENTIFIC",
  stopifmiss = FALSE,
  xtxt = NULL,
  dsn = NULL,
  dbconn = NULL,
```

```
  dbconnopen = FALSE,
  dbwrite = FALSE,
  dbreturn = TRUE,
  overwrite = TRUE,
  savedata = FALSE,
  savedata_opts = NULL,
  gui = FALSE
)
```

Arguments

xvar	String. Name of variable in the data table to join to.
x	Data frame or comma-delimited file (*.csv). The data table with variable to classify.
uniquex	String. Unique values to match, if x is NULL.
LUT	Data frame or comma-delimited file (*.csv). Name of the file with collapsed classes (If FIAname=FALSE).
LUTvar	String. Name of variable in LUT with values matching that xvar. If LUTvar=NULL, LUTvar=xvar.
LUTnewvar	String. Name(s) of other variable(s) in the look-up table to include in join. If NULL, all other variables in table will be included.
LUTnewvarnm	String. Different name(s) for LUTnewvar. If NULL, names will default to LUTnewvar. The length of LUTnewvarnm must equal the length for LUTnewvar.
FIAname	Logical. If TRUE, get FIA reference name based on (ref_codes) within FIESTA.
group	Logical. If TRUE and FIA=TRUE, the group variables in reference table (ref_codes) are merged to data table (GROUPCD, GROUPNM).
NAclass	String. NA values in xvar will be changed to NAclass.
add0	Logical. IF TRUE, keep all codes in look up table. If FALSE, only include codes that are in x.
spcdname	String. Name for species output type ('COMMON', 'SCIENTIFIC', 'SYMBOL', 'COMMON_SCIENTIFIC').
stopifmiss	Logical. IF TRUE, stops function if missing codes in LUTx.
xtxt	String.* Name of x table for more useful information in warnings.
dsn	String. Data source name of database with x.
dbconn	Open database connection.
dbconnopen	Logica. If TRUE, keep database connection open.
dbwrite	Logical. If TRUE, write class column to database table x.
dbreturn	Logical. If TRUE, return table with class column.
overwrite	Logical. If TRUE, and the class name already exists in x, overwrites class name.
savedata	Logical. If TRUE, saves data to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'datlut'.
gui	Logical. If gui, user is prompted for parameters.

Value

xLUT	The input data table with look-up table variable(s).
xLUTnm	Name of the new variable(s).
LUT	Look up table with categories.

If savedata = TRUE, a comma-delimited file is output to the outfolder as outfn. If outfn = NULL, the name of the file will be datlut_'date'.csv.

Note

For available reference tables: sort(unique(ref_codes$VARIABLE))

Author(s)

Tracey S. Frescino

Examples

```
# Append forest type names using the reference table above.
ref_fortypcd <- ref_codes[ref_codes$VARIABLE == "FORTYPCD",]
WYcondlut <- datLUTnm(WYcond,
                      xvar = "FORTYPCD",
                      LUT = ref_fortypcd,
                      LUTvar = "VALUE",
                      LUTnewvar = "MEANING",
                      LUTnewvarnm = "FORTYPNM")
names(WYcondlut)
WYcond2 <- WYcondlut$xLUT
head(WYcond2[WYcond2$FORTYPCD > 0, ])

# Append forest type names the FIAname parameter. If the xvar is in the stored
# reference table, the name and values will automatically be appended.
WYcondlut2 <- datLUTnm(WYcond,
                       xvar = "FORTYPCD",
                       FIAname = TRUE)
names(WYcondlut2)
WYcond3 <- WYcondlut2$xLUT
head(WYcond3[WYcond3$FORTYPCD > 0, ])
```

---

datLUTspp *Data - Gets variable description or class for SPCD.*

Description

Merge the ref_species table to append new variables, names, or categories to x.

Usage

```
datLUTspp(
  x = NULL,
  uniquex = NULL,
  NAclass = "Other",
  group = FALSE,
  states = NULL,
  spcdname = "COMMON",
  add0 = FALSE,
  stopifmiss = FALSE,
  xtxt = NULL,
  dsn = NULL,
  dbconn = NULL,
  dbconnopen = FALSE,
  dbwrite = FALSE,
  dbreturn = TRUE,
  overwrite = TRUE,
  savedata = FALSE,
  savedata_opts = NULL,
  gui = FALSE
)
```

Arguments

x	Data frame or comma-delimited file (*.csv). The data table with variable to classify.
uniquex	String. Unique values of SPCD to match, if x is NULL.
NAclass	String. NA values in xvar will be changed to NAclass.
group	Logical. If TRUE, the group variable in ref_species are merged to data table (E_SPGRPCD, W_SPGRPCD), depending on state(s) specified. If states overlap both E and W regions, the region with majority is used or E if equal. The group name is merged from ref_codes, SPGRPCD Variable.
states	String. Name of state(s) the x table is from.
spcdname	String. Name for species output type ('COMMON', 'SCIENTIFIC', 'SYMBOL', 'COMMON_SCIENTIFIC').
add0	Logical. IF TRUE, keep all codes in look up table. If FALSE, only include codes that are in x.
stopifmiss	Logical. IF TRUE, stops function if missing codes in LUTx.
xtxt	String.* Name of x table for more useful information in warnings.
dsn	String. Data source name of database with x.
dbconn	Open database connection.
dbconnopen	Logica. If TRUE, keep database connection open.
dbwrite	Logical. If TRUE, write class column to database table x.
dbreturn	Logical. If TRUE, return table with class column.

overwrite	Logical. If TRUE, and the class name already exists in x, overwrites class name.
savedata	Logical. If TRUE, saves data to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'datlut'.
gui	Logical. If gui, user is prompted for parameters.

Value

xLUT	The input data table with look-up table variable(s).
xLUTnm	Name of the new variable(s).
LUT	Look up table with categories.

If savedata = TRUE, a comma-delimited file is output to the outfolder as outfn. If outfn = NULL, the name of the file will be datlut_'date'.csv.

Note

For available reference tables: sort(unique(ref_codes$VARIABLE))

Author(s)

Tracey S. Frescino

Examples

```
WYtreelut <- datLUTspp(WYtree)
names(WYtreelut)
WYtree2 <- WYtreelut$xLUT
head(WYtree2)
```

---

datPBplotchg *Data - Generates barplot of photo-based change estimates.*

Description

Generate a bar plot of net change for photo-based estimates of land use / land cover change.

Usage

```
datPBplotchg(gainloss, CI = 95, figTitle = "")
```

Arguments

gainloss	Data frame or comma-delimited file (*.csv) - table with gain loss estimates.
CI	Number. Confidence Interval to include on plot.
figTitle	String. Title of figure.

Value

Outputs barplot to display window.

Note

If savedata = TRUE, writes a jpg and pdf of barplot to outfolder.

Author(s)

Tracey S. Frescino

---

datPBpnt2pct *Data - Transpose point data to plot-level percent by domain.*

Description

Calculates percent point by plot and domain and transpose to plot level.

Usage

```
datPBpnt2pct(pnt, uniqueid, tvar, othervars = NULL)
```

Arguments

pnt	DF/DT or comma-delimited file (*.csv). Point-level table with one record per point. If NULL, aggregated point counts must be in pntcnt.
uniqueid	String. Name of unique identifier of plot in pnt.
tvar	String. Name of variable to transpose.
othervars	String vector. Name(s) of plot-level variables to merge with transposed data.

Value

pltdom.pct	Data frame with transposed data.

Author(s)

Tracey S. Frescino

Examples

```
# Load necessary data from FIESTA
## Point data
icepntfn <- system.file("extdata",
                        "PB_data/icepnt_utco1135.csv",
                         package = "FIESTA")
icepnt <- read.csv(icepntfn)
```

```
# Convert to percent
percent <- datPBpnt2pct(pnt = icepnt,
                        uniqueid = "plot_id",
                        tvar = "cover_1")
head(percent)
```

---

datPivot *Data - Generates a pivot table.*

Description

Generates a pivot table of values by x row and y column.

Usage

```
datPivot(
  x,
  pvar,
  xvar,
  yvar,
  pfun = sum,
  xfilter = NULL,
  NAto0 = TRUE,
  dropNAxvar = TRUE,
  dropNAyvar = TRUE,
  pvar.round = 6,
  returnDT = FALSE,
  savedata = FALSE,
  savedata_opts = NULL,
  gui = FALSE
)
```

Arguments

x	Dataframe. Table with pivot variables.
pvar	String. The name of the variable for pivot table values.
xvar	String. The name of the variable for rows.
yvar	String. The name of the variable for columns.
pfun	Function. The name of the function to use for pivot table values (ex. sum, mean, max).
xfilter	String. A filter to subset the datatable table x before pivoting (ex. "STATUSCD == 1").
NAto0	Logical. If TRUE, converts NA values to 0.
dropNAxvar	Logical. If TRUE, removes columns that are NA.
dropNAyvar	Logical. If TRUE, removes rows that have NA values.

pvar.round	Integer. Number to round pvar values to.
returnDT	Logical. If TRUE, returns a datatable.
savedata	Logical. If TRUE, writes output data to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'datpivot'.
gui	Logical. If TRUE, pop-up windows will appear for user-interface.

Value

ptab	Matrix. The pivot table.

Author(s)

Tracey S. Frescino

Examples

```
# Pivot WYcond table
datPivot(x = FIESTA::WYcond,
         pvar = "CONDPROP_UNADJ",
         xvar = "FORTYPCD",
         yvar = "STDSZCD")

# Pivot WYtree table
datPivot(x = FIESTA::WYtree,
         pvar = "TPA_UNADJ",
         xvar = "SPCD",
         yvar = "STATUSCD",
         pfun = mean,
         NAto0 = TRUE)
```

---

datPlotcnt *Database - Get plot counts.*

Description

Extract plot counts by inventory year and state.

Usage

```
datPlotcnt(
  plt,
  yrtype = "INVYR",
  states = NULL,
  designcd = FALSE,
  forsamp = TRUE,
  total = TRUE,
```

```
  subtotal = TRUE,
  savedata = FALSE,
  outfolder = NULL,
  outfn = NULL,
  gui = FALSE
)
```

Arguments

plt	Data frame. Table of plot-level variables to count plots. If using this table, it must include INVYR.
yrtype	String. Type of year to categorize data ("INVYR", "MEASYEAR").
states	String vector. The states in plt table.
designcd	Logical. If TRUE, includes FIA design codes in the table.
forsamp	Logical. If TRUE, includes forest/nonforest/nonsampled codes in the table.
total	Logical. If TRUE, a row is added to bottom of table with a total for the whole table.
subtotal	Logical. If TRUE, a row is added to bottom of each section for subtotals.
savedata	Logical. If TRUE, saves data to outfolder as comma-delimited file (*.csv). No objects are returned. If FALSE, the data are saved as R objects and returned to user. See details for caveats.
outfolder	String. The output folder path. If NULL and savedata=TRUE or parameters=TRUE, outfolder is the working directory.
outfn	String. The name of the output file. If NULL, defaults to pltcnt_'date'.csv
gui	Logical. If TRUE, gui windows pop up for parameter selection.

Value

pltcnt - a dataframe of counts (YEAR, STABBR, STCD, PLOTS, NONSAMPLED, FOREST, NONFOREST)

Author(s)

Tracey S. Frescino

---

datSumCond *Data - Aggregates numeric condition data to plot level.*

Description

Aggregates CONDPROP_UNADJ variable or other continuous condition variables to plot level with option to apply condition filters. If condition variable is not CONDPROP_UNADJ the variable is multiplied by CONDPROP_UNADJ for weighted sum.

Usage

```
datSumCond(
  cond = NULL,
  datsource = "obj",
  data_dsn = NULL,
  plt = NULL,
  subp_cond = NULL,
  subplot = NULL,
  cuniqueid = "PLT_CN",
  puniqueid = "CN",
  condid = "CONDID",
  bycond = FALSE,
  bysubp = FALSE,
  subpid = "SUBP",
  csumvar = NULL,
  csumvarnm = NULL,
  cfilter = NULL,
  getadjplot = FALSE,
  adjcond = FALSE,
  NAto0 = FALSE,
  cround = 5,
  returnDT = TRUE,
  savedata = FALSE,
  savedata_opts = NULL,
  dbconn = NULL,
  dbconnopen = FALSE,
  gui = FALSE
)
```

Arguments

cond	Data frame or comma-delimited file (*.csv). Condition-level table with aggregate variable and CONDPROP_UNADJ.
datsource	String. Source of data ('obj', 'csv', 'sqlite', 'gdb').
data_dsn	String. If datsource='sqlite', the name of SQLite database (*.sqlite).
plt	Data frame, comma-delimited file (*.csv), shapefile (*.shp), or database file. Plot-level table to join the aggregated tree data to (if bycond=FALSE). Nonsampled plots (PLOT_STATUS_CD = 3) are removed. Optional.
subp_cond	Dataframe, comma-delimited file (*.csv), or shapefile (*.shp). Subplot condition-level table to use to sum condition proportions, if bysubp=TRUE.
subplot	Dataframe, comma-delimited file (*.csv), or shapefile (*.shp). Subplot-level table to used to calculate adjustment factors, to remove nonsampled conditions (SUBP_STATUS_CD = 3). This table is optional.
cuniqueid	String. Unique identifier of cond (default = "PLT_CN").
puniqueid	String. Unique identifier of plt (default = "CN").
condid	String. Unique identifier for conditions.

bycond	Logical. If TRUE, the data are aggregated to the condition level (by: cuniqueid, condid). If FALSE, the data are aggregated to the plot level (by: puniqueid).
bysubp	Logical. If TRUE, data are aggregated to the subplot level.
subpid	String. Unique identifier of each subplot.
csumvar	String. One or more variable names to sum to plot level.
csumvarnm	String. Name of the resulting aggregated plot-level variable(s). Default = csumvar + '_PLT'.
cfilter	String. A filter to subset the cond data before aggregating (e.g., "COND_STATUS_CD == 1"). Must be R syntax.
getadjplot	Logical. If TRUE, adjustments are calculated for nonsampled conditions on plot.
adjcond	Logical. If TRUE, csumvar condition variables are adjusted for nonsampled conditions by plot.
NAto0	Logical. If TRUE, convert NA values to 0.
cround	Number. The number of digits to round to. If NULL, default=5.
returnDT	Logical. If TRUE, returns data.table object(s). If FALSE, returns data.frame object(s).
savedata	Logical. If TRUE, saves data to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'condsum'.
dbconn	Open database connection.
dbconnopen	Logical. If TRUE, keep database connection open.
gui	Logical. If gui, user is prompted for parameters.

Details

If variable = NULL, then it will prompt user for input.

Value

A list of the following items:

condsum	Data frame. Plot-level table with aggregated condition attribute.
cfilter	Condition filter.

If savedata=TRUE, condsum is saved to the outfolder.

Note

Nonsampled plots are removed from table.

Author(s)

Tracey S. Frescino

Examples

```
# Aggregate LIVE_CANOPY_CVR_PCT to plot, weighted by CONDPROP_UNADJ
condsum <- datSumCond(cond = FIESTA::WYcond,
                      csumvar = "LIVE_CANOPY_CVR_PCT")$condsum

# Check results
condsum[condsum$PLT_CN == 40404737010690,]
FIESTA::WYcond[FIESTA::WYcond$PLT_CN == 40404737010690,]
```

`datSumTree` *Data - Aggregates tree and/or seedling data to the plot, condition, or subplot level.*

Description

Aggregates tree data (e.g., VOLCFNET) and/or seedling data (e.g., TPA_UNADJ) to plot, condition, or subplot. Includes options for filtering tree data, expanding to plot by multiplying by trees per acre (TPA_UNADJ), or adjusting for nonresponse at the plot level (getadjplot).

Usage

```
datSumTree(
  tree = NULL,
  seed = NULL,
  cond = NULL,
  plt = NULL,
  subp_cond = NULL,
  subplot = NULL,
  datsource = "obj",
  data_dsn = NULL,
  tuniqueid = "PLT_CN",
  cuniqueid = "PLT_CN",
  puniqueid = "CN",
  bycond = FALSE,
  condid = "CONDID",
  bysubp = FALSE,
  subpuniqueid = "PLT_CN",
  subpid = "SUBP",
  tsumvarlst = NULL,
  tsumvarnmlst = NULL,
  addseed = FALSE,
  seedonly = FALSE,
  woodland = "Y",
  TPA = TRUE,
  tfun = sum,
  ACI = FALSE,
  tfilter = NULL,
```

```
  lbs2tons = TRUE,
  metric = FALSE,
  getadjplot = FALSE,
  adjtree = FALSE,
  adjvar = "tadjfac",
  adjTPA = 1,
  NAto0 = FALSE,
  tround = 5,
  returnDT = TRUE,
  savedata = FALSE,
  savedata_opts = NULL,
  dbconn = NULL,
  dbconnopen = FALSE,
  gui = FALSE
)
```

Arguments

tree	Dataframe or comma-delimited file (*.csv). The tree-level table.
seed	Dataframe or comma-delimited file (*.csv). The seedling table.
cond	Dataframe or comma-delimited file (*.csv). Condition-level table to join the aggregated Ftree data to, if bycond=TRUE. This table also may be used for condition proportion or strata variables used if adjcond or adjstrata = TRUE (See details below). This table is optional.
plt	Dataframe, comma-delimited file (*.csv), or shapefile (*.shp). Plot-level table to join the aggregated tree data to, if bycond=FALSE. This table is optional.
subp_cond	Dataframe, comma-delimited file (*.csv), or shapefile (*.shp). Subplot condition-level table to use to sum condition proportions, if bysubp=TRUE.
subplot	Dataframe, comma-delimited file (*.csv), or shapefile (*.shp). Subplot-level table to used to calculate adjustment factors, to remove nonsampled conditions (SUBP_STATUS_CD = 3). This table is optional. If included the aggregated tree data are joined to subplot before returning.
datsource	String. Source of data ('obj', 'csv', 'sqlite', 'gdb').
data_dsn	String. If datsource='sqlite', the name of SQLite database (*.sqlite).
tuniqueid	String. Unique identifier of plt in tree table.
cuniqueid	String. Unique identifier of plt in cond table if cond is NOT NULL.
puniqueid	String. Unique identifier of plt table if plt is NOT NULL.
bycond	Logical. If TRUE, the data are aggregated to the condition level (by: cuniqueid, condid). If FALSE, the data are aggregated to the plot level (by: puniqueid). If bysubp = TRUE and bycond = TRUE, data are aggregated by subpuniqueid, subpid, condid.
condid	String. Unique identifier for conditions.
bysubp	Logical. If TRUE, data are aggregated to the subplot level.
subpuniqueid	String. Unique identifier of plot in subplot and subp_cond table.

subpid	String. Unique identifier of each subplot.
tsumvarlst	String (vector). Tree-level variable(s) to aggregate (e.g., "TPA_UNADJ", "BA"). Use "TPA_UNADJ" (tfun=sum) for summed tree count.
tsumvarnmlst	String (vector). Name of the tree-level variable(s) to aggregate (e.g., "TPALIVE", "BALIVE"). This list must have the same number of variables as tsumvarlst and be in respective order. If NULL, the default names will be tsumvar'_tfun' (e.g., "TPA_UNADJ_SUM", "BA_SUM").
addseed	Logical. If TRUE, add seedling counts to tree counts. Note: tdomvar must be 'SPCD' or 'SPGRPCD'.
seedonly	Logical. If TRUE, seedling counts only. Note: tdomvar must be 'SPCD' or 'SPGRPCD'.
woodland	String. If woodland = 'Y', include woodland tree species where measured. If woodland = 'N', only include timber species. See FIESTA::ref_species$WOODLAND ='Y/N'. If woodland = 'only', only include woodland species.
TPA	Logical. If TRUE, tsumvarlst variable(s) are multiplied by the respective trees-per-acre variable (see details) to get per-acre measurements.
tfun	Function. The name of the function to use to aggregate the data (e.g., sum, mean, max).
ACI	Logical. If TRUE, if ACI (All Condition Inventory) plots exist, any trees on these plots will be included in summary. If FALSE, you must include condition table.
tfilter	String. Filter to subset the tree data before aggregating (e.g., "STATUSCD == 1"). This must be in R syntax. If tfilter=NULL, user is prompted. Use tfilter="NONE" if no filters.
lbs2tons	Logical. If TRUE, converts biomass or carbon variables from pounds to tons (1 pound = 0.0005 short tons).
metric	Logical. If TRUE, converts response to metric units based on FIESTA::ref_conversion, if any variable in tsumvarlst is in FIESTAutils::ref_units. Note: if TPA, TPA is converted to trees per hectare (TPH: 1/ tpavar * 0.4046860).
getadjplot	Logical. If TRUE, adjustments are calculated for nonsampled conditions on plot.
adjtree	Logical. If TRUE, trees are individually adjusted by adjustment factors. Adjustment factors must be included in tree table (see adjvar).
adjvar	String. If adjtree=TRUE, the name of the variable to use for multiplying by adjustment (e.g., tadjfac).
adjTPA	Numeric. A tree-per-acre adjustment. Use for DESIGNCD=1 (annual inventory), if using less than 4 subplots. If using only 1 sublot for estimate, adjTPA=4. The default is 1.
NAto0	Logical. If TRUE, convert NA values to 0.
tround	Number. The number of digits to round to. If NULL, default=5.
returnDT	Logical. If TRUE, returns data.table object(s). If FALSE, returns data.frame object(s).
savedata	Logical. If TRUE, saves data to outfolder.

savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'treesum'.
dbconn	Open database connection.
dbconnopen	Logical. If TRUE, keep database connection open.
gui	Logical. If gui, user is prompted for parameters.

Details

For adjcond (bycond=FALSE):
If you want to summarize trees-per-acre information aggregated to plot or condition level, you need to include a TPA variable in tree table.
For tsumvars = GROWCFGS, GROWBFSL, GROWCFAL, FGROWCFGS, FGROWBFSL, or FGROWCFAL, you must have TPAGROW_UNADJ
For tsumvars = MORTCFGS, MORTBFSL, MORTCFAL, FMORTCFGS, FMORTBFSL, or FMORTCFAL, you must have TPAMORT_UNADJ
For tsumvars = REMVCFGS, REMVBFSL, REMVCFAL, FREMVCFGS, FREMVBFSL, or FREMVCFAL, you must have TPAREMV_UNADJ

If you want to adjust plot-level or subplot-level information by condition proportions (adjplot), you need to include CONDID & CONDPROP_UNADJ in cond or tree table and COND_STATUS_CD.

Value

A list of the following items:

treedat	Data frame. Plot or condition-level table with aggregated tree attributes.
sumvars	String vector. Name(s) of the output aggregated tree attributes.
tunitlst	String list. Units of output, when available.
tfilter	String list. Filter used.
meta	Data frame. Associated metadata, when available.

If savedata=TRUE
- treedat will be saved to the outfolder.
- a text file of input parameters is saved to outfolder ('outfn'_parameters_'date'.txt).

Note

If a dat table is provided, the aggregated tree data will be merged to table and NULL values will be output as 0.

Examples

```
# Aggregate LIVE_CANOPY_CVR_PCT to plot, weighted by CONDPROP_UNADJ
treesum <- datSumTree(tree = FIESTA::WYtree,
                      tsumvarlst = "TPA_UNADJ")$treedat

# Check results
treesum[treesum$PLT_CN == 40404737010690,]
FIESTA::WYtree[FIESTA::WYtree$PLT_CN == 40404737010690,]
```

---

datSumTreeDom *Data - Aggregates numeric tree data by tree domain (i.e. species) to plot or condition-level.*

Description

Aggregates numeric tree domain data (e.g., SPCD) to plot or condition, including options for filtering tree data or extrapolating to plot acre by multiplying by TPA. Includes options for generating barplots, proportion data, and cover data.

Usage

```
datSumTreeDom(
  tree = NULL,
  seed = NULL,
  cond = NULL,
  plt = NULL,
  subp_cond = NULL,
  subplot = NULL,
  datsource = "obj",
  data_dsn = NULL,
  tuniqueid = "PLT_CN",
  cuniqueid = "PLT_CN",
  puniqueid = "CN",
  bycond = FALSE,
  condid = "CONDID",
  bysubp = FALSE,
  subpid = "SUBP",
  tsumvar = NULL,
  addseed = FALSE,
  seedonly = FALSE,
  woodland = "Y",
  TPA = TRUE,
  tfun = sum,
  ACI = FALSE,
  tfilter = NULL,
```

```
  lbs2tons = TRUE,
  metric = FALSE,
  tdomvar = "SPCD",
  tdomvarlst = NULL,
  tdomvar2 = NULL,
  tdomvar2lst = NULL,
  tdomprefix = NULL,
  tdombarplot = FALSE,
  tdomtot = FALSE,
  tdomtotnm = NULL,
  FIAname = FALSE,
  spcd_name = "COMMON",
  pivot = TRUE,
  presence = FALSE,
  proportion = FALSE,
  cover = FALSE,
  getadjplot = FALSE,
  adjtree = FALSE,
  adjvar = "tadjfac",
  NAto0 = FALSE,
  adjTPA = 1,
  tround = 5,
  returnDT = TRUE,
  savedata = FALSE,
  savedata_opts = NULL,
  dbconn = NULL,
  dbconnopen = FALSE,
  gui = FALSE
)
```

Arguments

tree	Data frame or comma-delimited file (*.csv). The tree-level table with tree domain data.
seed	Data frame or comma-delimited file (*.csv). The seedling table with tree seedling counts. Only applicable for counts (tsumvar="PLT_CN").
cond	Data frame or comma-delimited file (*.csv). Condition-level table to join the aggregated tree data to, if bycond=TRUE. This table also may be used for condition proportion or strata variables used if adjcond or adjstrata = TRUE (See details below). This table is optional. If included, CONDID must be present in table.
plt	Dataframe, comma-delimited file (*.csv), or shapefile (*.shp). Plot-level table to join the aggregated tree data to, if bycond=FALSE. This table is optional.
subp_cond	Dataframe, comma-delimited file (*.csv), or shapefile (*.shp). Subplot condition-level table to use to sum condition proportions, if bysubp=TRUE.
subplot	Dataframe, comma-delimited file (*.csv), or shapefile (*.shp). Subplot-level table to used to calculate adjustment factors, to remove nonsampled conditions (SUBP_STATUS_CD = 3). This table is optional.

datsource	String. Source of data ('obj', 'csv', 'sqlite', 'gdb').
data_dsn	String. If datsource='sqlite', the name of SQLite database (*.sqlite).
tuniqueid	String. Unique identifier of the tree table. If including seedling table, this should be the same for seed.
cuniqueid	String. Unique identifier of the cond table if cond is NOT NULL.
puniqueid	String. Unique identifier of the plt table if plt is NOT NULL.
bycond	Logical. If TRUE, data are aggregated to the condition level (by: uniqueid, CONDID). If FALSE, data are aggregated to the plot level (by: uniqueid).
condid	String. Unique identifier for conditions.
bysubp	Logical. If TRUE, data are aggregated to the subplot level.
subpid	String. Unique identifier of each subplot.
tsumvar	String. Name of the variable to aggregate (e.g., "BA"). For summing number of trees, use tsumvar="TPA_UNADJ" with tfun=sum.
addseed	Logical. If TRUE, add seedling counts to tree counts. Note: tdomvar must be 'SPCD' or 'SPGRPCD'.
seedonly	Logical. If TRUE, seedling counts only. Note: tdomvar must be 'SPCD' or 'SPGRPCD'.
woodland	String. If woodland = 'Y', include woodland tree species where measured. If woodland = 'N', only include timber species. See FIESTA::ref_species$WOODLAND ='Y/N'. If woodland = 'only', only include woodland species.
TPA	Logical. If TRUE, tsumvarlst variable(s) are multiplied by the respective trees-per-acre variable (see details) to get per-acre measurements.
tfun	Function. Name of the function to use to aggregate the data (e.g., sum, mean, max).
ACI	Logical. If TRUE, if ACI (All Condition Inventory) plots exist, any trees on these plots will be included in summary. If FALSE, you must include condition table.
tfilter	String. A filter to subset the tree data before aggregating (e.g., "STATUSCD == 1"). This must be in R syntax. If tfilter=NULL, user is prompted. Use tfilter="NONE" if no filters.
lbs2tons	Logical. If TRUE, converts biomass or carbon variables from pounds to tons (1 pound = 0.0005 short tons).
metric	Logical. If TRUE, converts response to metric units based on FIESTA::ref_conversion, if tsumvar is in FIESTAutils::ref_units. Note: if TPA, TPA is converted to trees per hectare (TPH: 1/ tpavar * 0.4046860).
tdomvar	String. The tree domain (tdom) variable used to aggregate by (e.g., "SPCD", "SPGRPCD").
tdomvarlst	String (vector). List of specific tree domains of tdomvar to aggregate (e.g., c(108, 202)). If NULL, all domains of tdomvar are used.
tdomvar2	String. A second tree domain variable to use to aggregate by (e.g. "DIACL"). The variables, tdomvar and tdomvar2 will be concatenated before summed.

tdomvar2lst	String (vector). List of specific tree domains of tdomvar2 to aggregate. If NULL, all domains of tdomvar2 are used.
tdomprefix	String. The prefix used for naming the aggregated tree data, before numeric codes (e.g., "SP" = SP102, SP746).
tdombarplot	Logical. If TRUE and pivot=TRUE, calls datBarplot() and outputs a barplot of tdom distributions. If savedata=TRUE, barplots are written to outfolder.
tdomtot	Logical. If TRUE and pivot=TRUE a total of all tree domains in tdomvarlst is calculated and added to output data frame.
tdomtotnm	String. If tdomtot=TRUE, the variable name for the total column in output data frame. If NULL, the default will be tdomvar + 'TOT'.
FIAname	Logical. If TRUE, changes names of columns for SPCD and SPGRPCD from code to FIA names.
spcd_name	String. Output name type if tdomvar or tdomvar2 = "SPCD" ('COMMON', 'SCIENTIFIC', 'SYMBOL').
pivot	Logical. If TRUE, tdomvar data are transposed (pivoted) to separate columns.
presence	Logical. If TRUE, an additional table is output with tree domain values as presence/absence (1/0).
proportion	Logical. If TRUE and pivot=TRUE, an additional table will be output with tree domain data as proportions of total tsumvar.
cover	Logical. If TRUE and pivot=TRUE, , an additional table will be output with tree domain data as percent cover, based on proportions of tsumvar (see proportion) and tree canopy cover variable in cond (LIVE_CANOPY_CVR_PCT) or in plt (CCLIVEPLT). Does not include seedlings.
getadjplot	Logical. If TRUE, adjustments are calculated for nonsampled conditions on plot.
adjtree	Logical. If TRUE, trees are individually adjusted by adjustment factors. Adjustment factors must be included in tree table (see adjvar).
adjvar	String. If adjtree=TRUE, the name of the variable to use for multiplying by adjustment (e.g., tadjfac).
NAto0	Logical. If TRUE, convert NA values to 0.
adjTPA	Numeric. A tree-per-acre adjustment. Use for DESIGNCD=1 (annual inventory), if using less than 4 subplots. If using only 1 sublot for estimate, adjTPA=4. The default is 1.
tround	Number. The number of digits to round to. If NULL, default=6.
returnDT	Logical. If TRUE, returns data.table object(s). If FALSE, returns data.frame object(s).
savedata	Logical. If TRUE, saves data to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'tdomsum'.
dbconn	Open database connection.
dbconnopen	Logical. If TRUE, keep database connection open.
gui	Logical. If gui, user is prompted for parameters.

Details

If variable = NULL, then it will prompt user for input.

If you want to get trees-per-acre information aggregated to plot or condition level, you need to include a TPA variable in tree table.
For tsumvars = GROWCFGS, GROWBFSL, GROWCFAL, FGROWCFGS, FGROWBFSL, or FGROWCFAL, you must have TPAGROW_UNADJ
For tsumvars = MORTCFGS, MORTBFSL, MORTCFAL, FMORTCFGS, FMORTBFSL, or FMORTCFAL, you must have TPAMORT_UNADJ
For tsumvars = REMVCFGS, REMVBFSL, REMVCFAL, FREMVCFGS, FREMVBFSL, or FREMVCFAL, you must have TPAREMV_UNADJ

If you want to adjust plot-level information by condition proportions, you need to include CONDID & CONDPROP_UNADJ in cond or tree table.

If you want to adjust the aggregated tree data by the area of the strata (estimation unit), you need to either have a variable in your tree data named adjfact or you need to included the following variables in your datasets:
Condition table: STATECD, CONDID, STRATA, ESTUNIT, SUBPPROP_UNADJ, MICRPROP_UNADJ (if microplot trees) MACRPROP_UNADJ (if macroplot trees).
Tree table: TPA_UNADJ

All trees where DIA=NA are removed from analysis. These are trees that were remeasured but are no longer in inventory (ex. a tree that is dead and not standing in the current inventory).

Value

tdomdata - a list of the following objects:

`tdomdat`	Data frame. Plot or condition-level table with aggregated tree domain (tdom) attributes (filtered).
`tdomsum`	Data frame. The tdom look-up table with data aggregated by species.
`tdomvar`	String. Name of the tdom variable used to aggregate by.
`tsumvar`	String. Name of the aggregated output variable.
`tdomlst`	Vector. List of the aggregated tree data in tdomdat.
`tdomdat.pres`	Data frame. Plot or condition-level table with aggregated tree domain attributes represented as presence/absence (1/0).
`tdomdat.prop`	Data frame. Plot or condition-level table with aggregated tree domain attributes represented as proportion of total by plot.
`tdomdat.cov`	Data frame. Plot or condition-level table with aggregated tree domain attributes represented as percent cover, multipying cover attribute by tdom proportion by plot.

If savedata=TRUE
- tdomdat will be saved to the outfolder ('tdomprefix'_DAT.csv).
- a text file of input parameters is saved to outfolder ('outfn'_parameters_'date'.txt).
- if presence=TRUE, tdomdat.prop is saved to outfolder ('tdomprefix'_PRESDAT.csv) - if proportion=TRUE, tdomdat.prop is saved to outfolder ('tdomprefix'_PROPDAT.csv) - if cover=TRUE, tdomdat.prop is saved to outfolder ('tdomprefix'_COVDAT.csv)

Note

This function can be used to get tree domain data. This data can be used for mapping tree domain distributions.

              tround = 0)
```

DBgetCSV *Database - Extracts data table(s) from FIA DataMart.*

Description

Downloads and extracts compressed comma-delimited file(s) (*.zip) from FIA DataMart (https://apps.fs.usda.gov/fia/datamar
Only 1 table can be specified, but multiple states may be included.

Usage

```
DBgetCSV(
  DBtable,
  states = NULL,
  returnDT = FALSE,
  stopifnull = TRUE,
  noIDate = TRUE
)
```

Arguments

DBtable	String. Name of table to download. Only 1 table allowed.
states	String or numeric vector. Name (e.g., "Arizona", "New Mexico") or code (e.g., 4, 35) of states to download data. If NULL, tables that are not state-level are downloaded.
returnDT	Logical. If TRUE, a data table is returned, else, a data frame.
stopifnull	Logical. If TRUE, stop if table is NULL.
noIDate	Logical. If TRUE, do not include columns with type IDate.

Details

The compressed data files are downloaded from FIA DataMart; saved to a temporary space; extracted and imported; and deleted from temporary space. Accessibility and download time depends on access and speed of internet connection.

Value

Returns a data table (returnDT=TRUE), or data.frame (returnDT=FALSE) of downloaded table(s). If more than one state, returned as one table.

Author(s)

Tracey S. Frescino

Examples

```
## Not run:
# Get plot data for multiple states
FIAplots <- DBgetCSV("PLOT", c("Georgia", "Utah"))
table(FIAplots$STATECD)

## End(Not run)
```

DBgetEvalid — *Database - Gets or checks FIA EVALIDs and/or gets inventory years from FIA's online publicly-available DataMart (https://apps.fs.usda.gov/fia/datamart/CSV/datamart_csv.html).*

Description

Extracts FIA EVALIDs for identifying an estimation group of plots. EVALIDs may be extracted by most current evaluation (evalCur=TRUE) or by the end year of an evaluation (evalEndyr) or all evaluations in the database for one or more states. See details for more information.

Usage

```
DBgetEvalid(
  states = NULL,
  RS = NULL,
  datsource = "datamart",
  data_dsn = NULL,
  invtype = "ANNUAL",
  evalCur = TRUE,
  evalEndyr = NULL,
  evalid = NULL,
  evalAll = FALSE,
  evalType = "VOL",
  invyrtab = NULL,
  dbTabs = dbTables(),
  dbconn = NULL,
  dbconnopen = FALSE,
  returnPOP = FALSE,
  gui = FALSE
)
```

Arguments

states	String or numeric vector. Name (e.g., 'Arizona','New Mexico') or code (e.g., 4, 35) of state(s) for evalid. If all states in one or more FIA Research Station is desired, set states=NULL and use RS argument to define RS.
RS	String vector. Name of research station(s) ('RMRS','SRS','NCRS','NERS','PNWRS'). Do not use if states is populated.

datsource	Source of data ('datamart', 'sqlite').
data_dsn	If datsource='sqlite', the file name (data source name) of the sqlite database (*.sqlite).
invtype	String. The type of FIA data to extract ('PERIODIC', 'ANNUAL'). Only 1 allowed at a time. See further details below.
evalCur	Logical. If TRUE, the most current FIA Evaluation is extracted for state(s).
evalEndyr	Number. The end year of the FIA Evaluation period of interest. Selects only sampled plots and conditions for the evaluation period. If more than one state, create a named list object with evalEndyr labeled for each state (e.g., list(Utah=2014, Colorado=2013).
evalid	Integer. One or more EVALID to check if exists.
evalAll	Logical. If TRUE, gets all EVALIDs for invtype.
evalType	String vector. The type(s) of evaluation of interest ('ALL', 'CURR', 'VOL', 'GRM', 'P2VEG', 'DWM", 'INV', 'REGEN', 'CRWN'). The evalType 'ALL' includes nonsampled plots; 'CURR' includes plots used for area estimates; 'VOL' includes plots used for area and/or tree estimates; The evalType 'GRM' includes plots used for growth, removals, mortality, and change estimates (eval_typ are accepted. See details below and FIA database manual for regional availability and/or differences.
invyrtab	Data frame. A data frame including inventory years by state. If NULL, it is generated from SURVEY table from FIA database based on states and invtype.
dbTabs	List of database tables the user would like returned. See help(dbTables) for a list of options.
dbconn	Open database connection.
dbconnopen	Logical. If TRUE, the dbconn connection is not closed.
returnPOP	Logical. If TRUE, returns pop tables (SURVEY, POP_PLOT_STRATUM_ASSGN) as R objects instead of table names, if in db.
gui	Logical. If TRUE, gui windows pop up for parameter selection.

Details

FIA Evaluation
An Evaluation defines a group of plots in the FIA Database used for state-level estimates, representing different spans of data and different stratification and area adjustments. An Evaluation Type (evalType) is used to identify a specific set of plots for a particular response to be able to ensure a sample-based estimate for a population. See FIA's Database documentation for current available Evaluation Types and descriptions (https://www.fia.fs.fed.us/library/database-documentation/index.php).

EVALID
An EVALID is a unique code defining an Evaluation, generally in the format of a 2-digit State code, a 2-digit year code, and a 2-digit Evaluation Type code.

EVAL_TYP

EVALIDCD	EVAL_TYP	Description

00	EXPALL	All area
01	EXPVOL/EXPCURR	Area/Volume
03	EXPCHNG/EXPGROW/EXPMORT/EXPREMV	Area Change/GRM
07	EXPDWM	DWM
08	EXPREGEN	Regeneration
09	EXPINV	Invasive
10	EXPP2VEG	Veg profile
12	EXPCRWN	Crown

Value

A list of the following objects:

states	String vector. State names.
rslst	String vector. FIA research station names included in output.
evalidlist	Named list. evalid by state.
invtype	String. Inventory type for states(s) (ANNUAL/PERIODIC).
invyrtab	Data frame. Inventory years by state for evalidlist.
evalTypelist	Named list. Evaluation type(s) by state.
invyrs	Named list. Inventory years by state for evalidlist.
SURVEY	Data frame. If returnPOP=TRUE, the SURVEY table from FIADB.

Note

FIA database tables used:
1. SURVEY - To get latest inventory year, invyrtab = NULL
2. POP_EVAL - To get EVALID and EVALID years

Author(s)

Tracey S. Frescino

Examples

```
## Not run:
# Get evalid and inventory years for Wyoming
WYeval <- DBgetEvalid(states="Wyoming")
names(WYeval)

WYeval$evalidlist
WYeval$invtype
WYeval$invyrtab
WYeval$evalType
WYeval$invyrs

# Get evalid for Utah and Wyoming
```

```
DBgetEvalid(states=c("Wyoming", "Utah"))

# Get evalid for an FIA Research Station
RSevalid <- DBgetEvalid(RS="NERS")
names(RSevalid)
RSevalid$evalidlist

## End(Not run)
```

DBgetPlots *Database - Extracts inventory plot data from FIA DataMart.*

Description

Extracts data from FIA's online publicly-available DataMart (https://apps.fs.usda.gov/fia/datamart/CSV/datamart_csv.html).

Usage

```
DBgetPlots(
  states = NULL,
  RS = NULL,
  datsource = "datamart",
  data_dsn = NULL,
  dbTabs = dbTables(),
  eval = "FIA",
  eval_opts = NULL,
  puniqueid = "CN",
  invtype = "ANNUAL",
  intensity1 = FALSE,
  issubp = FALSE,
  istree = TRUE,
  isseed = FALSE,
  greenwt = FALSE,
  addplotgeom = FALSE,
  othertables = NULL,
  getxy = FALSE,
  xy_datsource = NULL,
  xy_dsn = NULL,
  xy = "PLOT",
  xy_opts = xy_options(),
  xymeasCur = FALSE,
  coordType = "PUBLIC",
  pjoinid = NULL,
  issp = FALSE,
  spcond = FALSE,
  spcondid1 = FALSE,
  defaultVars = TRUE,
  regionVars = FALSE,
```

```
  regionVarsRS = "RMRS",
  ACI = FALSE,
  subcycle99 = FALSE,
  stateFilter = NULL,
  allFilter = NULL,
  alltFilter = NULL,
  returndata = TRUE,
  savedata = FALSE,
  exportsp = FALSE,
  saveqry = FALSE,
  savePOP = FALSE,
  savedata_opts = NULL,
  dbconn = NULL,
  dbconnopen = FALSE,
  evalInfo = NULL,
  ...
)
```

Arguments

states	String or numeric vector. Name (e.g., 'Arizona','New Mexico') or code (e.g., 4, 35) of state(s) for evalid. If all states in one or more FIA Research Station is desired, set states=NULL and use RS argument to define RS.
RS	String vector. Name of research station(s) to get public XY coordinates for ('RMRS','SRS','NCRS','NERS','PNWRS'). Do not use if states is populated. See FIESTA::ref_statecd for reference to RS and states.
datsource	String. Source of data ('datamart', 'sqlite').
data_dsn	String. If datsource='sqlite', the name of SQLite database (*.sqlite).
dbTabs	List. Source of tables needed for estimation based on what is defined in eval_opts(Type). The source can be a layer in data_dsn or a comma delimited file. For example, if Type='P2VEG', vsubpspp_layer and/or vsubpstr_layer must be defined. Defaults are 'P2VEG_SUBPLOT_SPP' and 'P2VEG_SUBP_STRUCTURE', respectively. See help(dbTables) for a list of options.
eval	String. Type of evaluation time frame for data extraction ('FIA', 'custom'). See eval_opts for more further options.
eval_opts	List of evaluation options for 'FIA' or 'custom' evaluations to determine the set of data returned. See help(eval_options) for a list of options.
puniqueid	String. Name of unique identifier in plot_layer in dbTabs.
invtype	String. Type of FIA inventory to extract ('PERIODIC', 'ANNUAL', 'BOTH').
intensity1	Logical. If TRUE, includes only plots where INTENSITY = 1.
issubp	Logical. If TRUE, subplot tables are extracted from FIA database (SUBPLOT, SUBP_COND).
istree	Logical. If TRUE, include tree data.
isseed	Logical. If TRUE, include seedling data.
greenwt	Logical. If TRUE, green weight biomass is calculated.

addplotgeom	Logical. If TRUE, variables from the PLOTGEOM table are appended to the plot table.
othertables	String Vector. Name of other table(s) in FIADB to include in output. The table must have PLT_CN as unique identifier of a plot.
getxy	Logical. If TRUE, gets separate XY table.
xy_datsource	Source of XY data ('obj', 'csv', 'datamart', 'sqlite').
xy_dsn	If datsource='sqlite', the file name (data source name) of the sqlite database (*.sqlite) where XY data are.
xy	sf R object or String. Table with xy coordinates. Can be a spatial polygon object, data frame, full pathname to a shapefile, or name of a layer within a database.
xy_opts	List of xy data options to specify if xy is NOT NULL. See xy_options (e.g., xy_opts = list(xvar='LON', yvar='LAT').
xymeasCur	Logical. If TRUE, include XY coordinates from the most current sampled measurement of each plot.
coordType	String. Type of xy coordinates using ('PUBLIC', 'ACTUAL')
pjoinid	String. Variable in plt to join to XY data. Not necessary to be unique. If using most current XY coordinates, use identifier for a plot (e.g., PLOT_ID).
issp	Logical. If TRUE, an sf spatial object is generated from the public X/Y coordinates in the plot table.
spcond	Logical. If TRUE, a set of condition-level attributes (e.g., FORTYPCD) represented at the plot-level are extracted from FIA DataMart COND table. (See Notes for more info on how condition attributes were added).
spcondid1	Logical. If TRUE and issp=TRUE and spcond=TRUE, condition variables are determined by condition 1 attributes. If FALSE, an algorithm is used to select the condition to use (See details for alorithm used).
defaultVars	Logical. If TRUE, a set of default variables are selected in query. See notes for variable descriptions.
regionVars	Logical. If TRUE, regional variables are included in query (e.g., SDI_RMRS, SDIPCT_RMRS, SDIMAX_RMRS, QMD_RMRS).
regionVarsRS	String. Region for regionVars ('RMRS','SRS','NCRS','NERS','PNWRS').
ACI	Logical. If TRUE, the data from All Condition Inventories (ACI) are included in dataset (NF_SAMPLING_STATUS_CD = 1). See below for more details.
subcycle99	Logical. If TRUE, includes plots with SUBCYCLE = 99. These plots are plots that are measured more than once and are not included in the estimation process.
stateFilter	Character string or Named list. Logical statement to use as plot and filter in sql query. Must include plot alias ('p.') and be sql syntax (e.g., 'p.COUNTYCD = 1'). If more than 1 state, stateFilter must be a named list with names as state(s) (e.g., list(Utah='p.COUNTYCD = 1').
allFilter	String. An overall filter for plot or condition data in all states in query. The expression must be R syntax (e.g., 'PLOT_STATUS_CD == 1').
alltFilter	String. If istree=TRUE, an overall filter for tree data in all states (e.g., only Whitebark pine trees - 'SPCD == 101'). Note: returns only plots with trees included in filter.

returndata	Logical. If TRUE, returns data objects.
savedata	Logical. If TRUE, saves data to outfolder as comma-delimited file (*.csv). No objects are returned. If FALSE, the data are saved as R objects and returned to user. See details for caveats.
exportsp	Logical. If TRUE, and issp=TRUE, exports spatial plots.
saveqry	Logical. If TRUE, saves queries to outfolder (by state).
savePOP	Logical. If TRUE, save and return the POP_PLOT_STRATUM_ASSGN table.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL,
dbconn	Open database connection.
dbconnopen	Logical. If TRUE, the dbconn connection is not closed.
evalInfo	List. List object output from DBgetEvalid or DBgetXY
...	For extendibility. FIESTA functions.

Details

FIA forest land definition

Current
Forested plots include plots with >= 10 percent cover (or equivalent stocking) by live trees of any size, including land that formerly had such tree cover and that will be naturally or artificially regenerated. To qualify, the area must be >= 1.0 acre in size and 120.0 feet wide (See Burrill et al. 2018).

ACI (All Condition Inventory)
RMRS National Forest plots. For nonforest conditions that have been visited in the field (NF_SAMPLING_STATUS_CD = if trees exist on the condition, the data exist in the tree table. If you do not want these trees included, ACI=FALSE. This will filter the data to only forested conditions (COND_STATUS_CD = 1)

Nevada
In 2016, the population area of Nevada changed to exclude the large restricted area owned by Department of Defense (Area 51) from the sample. Prior to 2016, the plots within this area were observed using aerial photos and if they were definitely nonforest the plots were entered in the database with nonforest information. If they were observed as forested or potentially forested, they were given a PLOT_STATUS_CD=3 because they were Denied Access. From 2016 on, all plots within this area are removed from the sample, and thus, removed from database.

FIA DataMart Data

FIA data available on FIA DataMart include the following information.

- the PLOT variable is renumbered.
- the LON/LAT coordinates are fuzzed & swapped.
- the OWNERCD variable is based on fuzzed & swapped locations.
- ECOSUBCD, CONGCD, ELEV, and EMAP_HEX are GIS-extracted values based on fuzzed & swapped locations.
- For annual data, forested plots represent the current definition of >= 10 percent cover...
- For periodic data, forested plots are defined by a definition of Other Wooded Land (OWL), including >= 5 percent cover...

FIA Evaluations

An evaluation is a group of plots within the FIA database that is used for generating population estimates, representing different inventory spans of data with different stratification or area adjustments. Each evaluation is determined by the type of estimation (Type) including: area and tree estimates; growth, removal, and mortality estimates; and area change estimates (EVAL_TYPE). These plots are identified by an evalid, which is a unique identifier in the format of a 2-digit State code, a 2-digit year code, and a 2-digit evaluation type code. For example, EVALID '491601' represents the Utah 2016 evaluation for current area estimates.

FIA Evaluation Types

Define one or more Evaluation Type for Cur=TRUE or Endyr=YYYY. An Evaluation type is used to identify a specific set of plots for a particular response that can be used to a make a statistically valid sample-based estimate. If Type='CURR', the evaluation includes all sampled and nonsampled plots or plots that were missed in an inventory year.

Regional differences may occur on how missed plots are represented in a FIA Evaluation. For example, RMRS Evaluations are static; missed plots are included in an Evaluation as nonsampled, and when measured, are included in a following Evaluation. Therefore, the number of nonsampled plots in previous Evaluations may change, depending on when missed plot are measured. In the PNW Research Station, plots are brought forward to replace missed plots in an evaluation, depending on the Type.

EVAL_TYP

EVALIDCD	EVAL_TYP	Description
00	EXPALL	All area
01	EXPVOL/EXPCURR	Area/Volume
03	EXPCHNG/EXPGROW/EXPMORT/EXPREMV	Area Change/GRM
07	EXPDWM	DWM
08	EXPREGEN	Regeneration
09	EXPINV	Invasive
10	EXPP2VEG	Veg profile
12	EXPCRWN	Crown

Inventory span defining variables

Data can be extracted using FIA Evaluations or a custom-defined Evaluation for one or more states, one or more FIA Research Stations (RS), or all available states in database (states=NULL, RS=NULL).

FIA Evaluation (eval=FIA)

eval_option	Description
evalid	Specified FIA EVALID (e.g., 491801)
Cur	Most current FIA Evaluation
Endyr	End year of an FIA Evaluation (e.g., 2018)
All	All evaluations in database
Type	Type of FIA Evaluation (response)

Custom evaluation (eval="custom")

eval_option	Description
Cur	Most current measurement of plot in database
Endyr	Most current measurement of plot in database in or before year
All	All years for invtype (ANNUAL or PERIODIC or BOTH)
Type	Type of custom Evaluation (response)
invyrs	Specified inventory years (e.g., 2015:2018)

Spatial data

If issp=TRUE, an sf spatial object of plot-level attributes is generated from public coordinates, with NAD83 Geographic Coordinate Reference System.

Exporting
If savedata=TRUE and out_fmt="shp", the spatial object is exported to the outfolder using the ESRI Shapefile driver. The driver truncates variable names to 10 characters or less. Variable names are changed using an internal function. The name changes are written to a csv file and saved to the outfolder (shpfile_newnames.csv).

spcond
Only one condition per plot is used for spatial representation of condition attributes. IF CONDID1=TRUE, condition 1 is selected. If CONDID1=FALSE, the condition is selected based on the following criteria. A column named CONDMETHOD is added to the attribute table to show the method and steps used, identified by the abbreviation in parentheses.

(1) minimum COND_STATUS_CD (_ST)
(2) maximum condition proportion (_CP)
(3) maximum live_canopy_cvr_pct (_CC)
(4) minimum STDSZCD (_SZ)
(5) minimum CONDID (_C1)

Derived Variables

If defaultVars=TRUE, the following derived variables are calculated after extracting data from the FIA database.

Plot-level variables:

NBRCND - Number of conditions on plot, including nonsampled conditions (COND_STATUS_CD = 5)
NBRCNDSAMP - Number of sampled conditions on plot.
NBRCNDFOR - Number of sampled forested conditions on plot.
NBRCNDFTYP - Number of sampled forested conditions with different forest types on plot.
NBRCNDFGRP - Number of sampled forested conditions with different forest type groups on plot.
CCLIVEPLT - Percent live canopy cover of condition aggregated to plot-level (LIVE_CANOPY_CVR_PCT * CONDPRO
PLOT_ID - Unique Identifier for a plot ('ID' + STATECD(2) + UNITCD(2) + COUNTYCD(3) + PLOT(5)). This variable

Condition-level variables:

FORTYPGRP - TYPGRPCD merged to FORTYPCD
FLDTYPGRP - TYPGRPCD merged to FLDTYPCD
FORNONSAMP - Combination of PLOT_STATUS_CD and PLOT_NONSAMPLE_REASN_CD
QMD - Quadratic Mean Diameter

Tree-level variables:

BA - the basal area of a tree (BA = DIA * DIA * 0.005454)

TREE AGE Notes:
- Available for live timber and woodland trees in the following states: AZ,CO,ID,MT,NV,UT,OR,WA.
- BHAGE - Breast height age (4.5' above ground) of timber trees.
- PNW - one tree is sampled for each species, within each crown class, and for each condition class present on plot. Age of
- RMRS - one tree is sampled for each species and broad diameter class present on plot.

DRYBIO Notes:
DRYBIO_AG - Aboveground oven-dry biomass, in pounds (DRYBIO_AG = (DRYBIO_BOLE + DRYBIO_STUMP + DR
- Available for both timber and woodland species, live trees >= 1.0" DIA and dead trees >= 5.0" DIA. Summed dry biomass
- DRYBIO_BOLE - dry biomass of sound wood in live and dead trees, including bark, from a 1-foot stump to a min 4-inch
- DRYBIO_STUMP - dry biomass in the tree stump, including the portion of the tree from the ground to the bottom of mer
- DRYBIO_TOP - dry biomass in the top of the tree, including the portion of the tree above merchantable bole, 4-inch top,
- DRYBIO_SAPLING - dry biomass of saplings, including aboveground portion, excluding foliage, of live timber trees >=1
- DRYBIO_WDLD_SPP - dry biomass of woodland trees, live or dead, including the aboveground portion, excluding foliag

ABOVEGROUND CARBON ESTIMATES (IN POUNDS)
Available for both timber and woodland species, live trees >= 1.0" DIA and dead trees >= 5.0" DIA.
Calculated as 1/2 of the aboveground estimates of biomass:
CARBON_AG = 0.5 * (DRYBIO_AG)

TREE AGE DATA ONLY IN FOR ("AZ", "CO", "ID", "MT", "NV", "UT")
FMORTCFAL includes trees >= 5.0" DIA and greater and is not populated for states("CA", "OR", "WA", "OK")
Mortality variables only available in: AZ, CO, ID, MT, NV, NM, UT, WY, ND, SD, NE, KS, OK.

TPA If TPA=TRUE and istree=TRUE or isseed=TRUE, the following tree/seedling variables are multiplied by trees-per-acre (TPA_UNADJ). TPA_UNADJ is set to a constant derived from the plot size and equals 6.018046 for trees sampled on subplots, 74.965282 for trees sampled on microplots, and 0.999188 for trees sampled on macroplots. Variable-radius plots were often used in earlier inventories, so the value in TPA_UNADJ decreases as the tree diameter increases (FIADB User Guide)

Variables: VOLCFNET, VOLCFGRS, GROWCFGS, GROWCFAL, FGROWCFGS, FGROWCFAL, MORTCFGS, MORTCFAL, FMORTCFGS, FMORTCFAL, REMVCFGS, REMVCFAL, FREMVCFGS, FREMVCFAL, DRYBIO_BOLE, DRYBIO_STUMP, DRYBIO_TOP, DRYBIO_SAPLING, DRYBIO_WDLD_SPP, DRYBIO_BG, CARBON_BG, CARBON_AG

MISC

For regions outside RMRS, there is no OWNCD attached to nonforest lands.

Value

if returndata=TRUE, a list of the following objects:

`states` Vector. Input state(s) (full state names: Arizona).

`tabs` List. A list of data frames from FIA database, including plt and cond; and tree (if Type='VOL'); seed (if isseed=TRUE), p2veg_subplot_spp, p2veg_subp_structure, and invasive_subplot_spp (if Type='P2VEG'). See below 'Output Tables - FIA Table Names' for reference to FIA database tables. See FIESTA:ref_* for variable descriptions (e.g., FIESTAutils::ref_tree). If istree and the number of states > 3, tree data are saved to outfolder and not returned to accommodate R memory issues.

`xy*_PUBLIC` Data frame. XY data from FIA's public database. If measCur=TRUE, named xyCur_PUBLIC, else named xy_PUBLIC. The data frame has 10 columns ('PLT_CN', 'LON_PUBLIC', 'LAT_PUBLIC', 'STATECD', 'UNITCD', 'COUNTYCD', 'PLOT', 'INTENSITY', 'PLOT_ID' (ID+STATECD+UNTCD+COUNTYCD+PLOT), 'COUNTYFIPS'. If issp=TRUE, returns an sf object.

`spconddat` If spcond=TRUE, the condition variables representing each plot for spatial display. For plots with multiple conditions, the selected condition is based on CONDID=1 (if spcondid1=TRUE) or a set if criteria defined in Details - spcond (if spcondid1=FALSE).

`evalid` Number. If evalCur=TRUE or evalEndyr is not NULL, the Evalidation ID from the FIA database used to define the output data.

`pltcnt` Data frame. Number of plots (NBRPLOTS) by state, cycle, inventory year, and plot status.

`pop_plot_stratum_assgn`
Data frame. If savePOP=TRUE, and FIA Evaluations are used to extract data from database, return the POP_PLOT_STRATUM_ASSGN table or, if more than one Type and savePOP=FALSE. If more than one Type, only the records for the evalTypes are returned, otherwise all Types for the state evaluation are returned.

Output Tables - FIA Table Names

tab	FIA Table
plt	plot
cond	cond
tree	tree
p2veg_subplot_spp	P2VEG_SUBPLOT_SPP

p2veg_subp_structure	P2VEG_SUBP_STRUCTURE
invsubp	INVASIVE_SUBPLOT_SPP
subplot	SUBPLOT
subp_cond	SUBP_COND
cond_dwm_calc	COND_DWM_CALC
grm	TREE_GRM_COMPONENT
issccm	SUBP_COND_CHNG_MTRX

#' Outputs to outfolder (if savedata=TRUE):

- If saveqry=TRUE, text file(s) of SQL queries used to extract data from database (_.txt). Note: one query is used for extrac
- CSV file of plot and condition counts (pltcnt*.txt).
- Layers in a database or CSV files of output tables.
- If issp=TRUE, a feature class or ESRI shapefile of plot-level level attributes. If shapefile (.shp), variable names are truncat
- If issp=TRUE and out_fmt='sqlite', the SQLite data is SpatiaLite.

To deal with limitations of R object size and/or computer memory issues, if istree=TRUE and more than three states are desired, the tree data are saved to a CSV file, with no tree data object returned.

Note

If no parameters are included, the user is prompted for input. If partial parameters, the default parameter values are used for those not specified.

Data Access All data are downloaded from FIA's publicly-available online Datamart (https://apps.fs.usda.gov/fia/datamart/CS

Because of FIA's confidentiality agreement to protect the privacy of landowners as well as protecting the scientific integrity of FIA's sample design, the exact coordinates of the sample plot locations are not included. The X/Y coordinates (LON_PUBLIC/LAT_PUBLIC) for download are perturbed up to a mile from the original location (https://www.fia.fs.fed.us/tools-data/spatial/Policy/index.php). If the exact location of the plots are necessary for your analysis, contact FIA's Spatial Data Services (https://www.fia.fs.fed.us/tools-data/spatial/index.php).

## End(Not run)
```

DBgetSQLite *Database - Queries a SQLite database table.*

Description

Extracts and queries data from a SQLite (*.sqlite) database (Note: must use SQL syntax).

Usage

```
DBgetSQLite(states = NULL, outfolder = NULL)
```

Arguments

states	String. Vector of one or more state names.
outfolder	String. The output folder path. If NULL, outfolder is the working directory.

Value

Returns nothing.

Author(s)

Tracey S. Frescino

Examples

```
## Not run:
# Extract data from Washington state
DBgetSQLite(states = "WA")

# Extract data from Utah and California, save to an outfolder
DBgetSQLite(states = c("UT", "CA"),
            outfolder = tempdir())

## End(Not run)
```

DBgetStrata *Database - Gets stratification information from FIA database.*

Description

Gets strata information from FIA's Oracle database or FIA DataMart, including: (1) strata and estimation unit assignment per plot; (2) total area by estimation unit; (3) pixel counts and number plots by strata/estimation unit. Include a data frame of plots, states, or evaluation information.

Usage

```
DBgetStrata(
  dat = NULL,
  uniqueid = "CN",
  datsource = "datamart",
  data_dsn = NULL,
  states = NULL,
  eval_opts = eval_options(Cur = TRUE),
  savedata = FALSE,
  getassgn = TRUE,
  pop_plot_stratum_assgn = NULL,
  savedata_opts = NULL,
  dbconn = NULL,
  dbconnopen = FALSE,
  evalInfo = NULL,
  ...
)
```

Arguments

dat	Data frame, comma-delimited file (*.csv), or shapefile (*.shp). The strata value is merged to this table and returned as a data frame. See details for necessary variables.
uniqueid	String. The unique plot identifier of dat (e.g., 'CN').
datsource	String. Source of data ('datamart', 'sqlite').
data_dsn	String. If datsource='sqlite', the name of SQLite database (*.sqlite).
states	String or numeric vector. Name(s) (e.g., 'Arizona','New Mexico') or code(s) (e.g., 4, 35) of states for strata if dat=NULL.
eval_opts	List of evaluation options for 'FIA' or 'custom' evaluations to determine the set of data returned. See help(eval_options) for a list of options.
savedata	Logical. If TRUE, writes output to outfolder.
getassgn	Logical. If TRUE, extracts plot assignments from pop_plot_stratum_assgn table in database.
pop_plot_stratum_assgn	Data frame. The pop_plot_stratum_assgn for state(s).
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
dbconn	Open database connection.
dbconnopen	Logical. If TRUE, the dbconn connection is not closed.
evalInfo	List. List object output from DBgetEvalid or DBgetXY
...	For extendibility. FIESTA functions.

Details

The following variables must be present in dat: STATECD, UNITCD, INVYR, a uniqueid (e.g. "PLT_CN"), and PLOT_STATUS_CD (if nonsampled plots in dataset).

FIADB TABLES USED:

FS_FIADB.SURVEY	To get latest inventory year.
FS_FIADB.POP_EVAL	To get EVALID and EVALID years.
FS_FIADB.POP_ESTN_UNIT	To get total area by estimation unit (AREATOT_EU-includes water).
FS_FIADB.POP_STRATUM	To get pixel counts by stratum and estimation unit.
FS_FIADB.POP_PLOT_STRATUM_ASSGN	To get estimation unit & stratum assignment for each plot.

Area by estimation unit includes total area for all plots (Type="CURR").

Value

FIAstrata - a list of the following objects:

`pltassgn`	Data frame. Plot-level strata/estimation unit assignment. If dat is not NULL, strata/estimation unit variables are appended to dat.
`pltassgnid`	String. Name of unique identifier of plot in pltassgn.
`unitarea`	Data frame. Total acres by estimation unit.
`unitvar`	String. Name of the estimation unit variable (ESTN_UNIT).
`areavar`	String. Name of the acre variable (ACRES).
`stratalut`	Data frame. Strata look-up table with summarized pixel counts (P1POINTCNT) by strata/estimation unit.
`strvar`	String. Name of the strata variable (STRATA).
`strwtvar`	String. Name of the strata weight variable (P1POINTCNT).
`evalid`	List. evalid by state.

Outputs to outfolder (if savedata=TRUE):

- CSV file of pltassgn (*'date'.csv).
- CSV file of unitarea (*'date'.csv).
- CSV file of stratalut (*'date'.csv).
- If collapsed, a CSV file of original classes and new collapsed classes.

Note

Steps used in data extraction:

1. Get EVALID and EVALID years by state - DBgetEvalid().
2. unitarea: get total area by estimation unit for EVALID (POP_ESTN_UNIT).
3. stratalut: get pixel counts by estimation unit and stratum for EVALID (POP_STRATUM).

4. pltassgn: get estimation unit and stratum assignment for each plot for EVALID. (POP_PLOT_STRATUM_ASSGN).
5. If dat is not NULL, merge pltassgn assignment to dat.
6. Merge number of plots to stratalut
7. Check for only 1 MEASYEAR or 1 INVYR and number of plots by strata/estimation unit. If less than minimumnum plots per strata/estimation unit collapse using the following algorithm.

Strata collapsing:
If there are less than minplotnum (10) plots in the smallest strata of the estimation unit, these plots are grouped with the larger strata in the same estimation unit and defined as the highest strata value. If, after grouping, there are still less than minplotnum, all of these plots are combined with the corresponding strata of the estimation unit above. If there are no records above, then they are combined with the estimation unit below. The process repeats, grouping the strata to the highest strata value if necessary. All grouping is restrained within survey units (UNITCD).

More than one evaluation:
If attributing a table of plots and there are plots that have been visited more than once, all plots are assigned an estimation unit and strata value, but the area and strata proportions are from the most current evaluation for the dataset. The plots outside the most current evaluation are attributes with values from the next most current evaluation occurring in the database.

Examples

```
## Not run:
# Get strata for the most current evaluation of a state (ex. Wyoming)
WYstrat1 <- DBgetStrata(states = "Wyoming",
                        eval_opts = list(Cur = TRUE))
names(WYstrat1)

head(WYstrat1$pltassgn)
WYstrat1$unitarea
WYstrat1$unitvar
WYstrat1$areavar
WYstrat1$strvar
WYstrat1$evalid

# Get strata information for a specific set of plots
WYstrat4 <- DBgetStrata(dat = WYplt)
names(WYstrat4)

head(WYstrat4$pltassgn)
WYstrat4$unitarea
WYstrat4$evalid

## End(Not run)
```

DBgetXY *Database - Extracts plot coordinates.*

Description

Extracts public plot coordinates for an FIA evaluation or a custom evaluation. Plots are extracted from FIA's public Datamart (https://apps.fs.usda.gov/fia/datamart/datamart.html) or other defined datasource.

Usage

```
DBgetXY(
  states = NULL,
  RS = NULL,
  xy_datsource,
  xy_dsn = NULL,
  xy = "PLOT",
  xy_opts = xy_options(),
  datsource = NULL,
  data_dsn = NULL,
  dbTabs = dbTables(),
  pjoinid = "CN",
  eval = "FIA",
  eval_opts = eval_options(),
  invtype = "ANNUAL",
  coordType = "PUBLIC",
  intensity1 = FALSE,
  pvars2keep = NULL,
  issp = FALSE,
  returndata = TRUE,
  savedata = FALSE,
  exportsp = FALSE,
  savedata_opts = NULL,
  PLOT = NULL,
  POP_PLOT_STRATUM_ASSGN = NULL,
  SURVEY = NULL,
  dbconnopen = FALSE,
  evalInfo = NULL
)
```

Arguments

states	String or numeric vector. Name (e.g., 'Arizona','New Mexico') or code (e.g., 4, 35) of state(s) for evalid. If all states in one or more FIA Research Station is desired, set states=NULL and use RS argument to define RS.

RS	String vector. Name of research station(s) to get public XY coordinates for ('RMRS','SRS','NCRS','NERS','PNWRS'). Do not use if states is populated. See FIESTA::ref_statecd for reference to RS and states.
xy_datsource	Source of XY data ('datamart', 'sqlite', 'obj', 'csv').
xy_dsn	If datsource='sqlite', the file name (data source name) of the sqlite database (*.db) where XY data reside.
xy	sf R object or String. If xy_dsn = 'datamart', name of xy table in FIA DataMart. If xy_dsn = 'sqlite', name of xy layer in database. If datsource = 'csv', full pathname of xy CSV file(s). If datsource = 'obj', name of xy R object. If datsource = 'shp', full pathname of shapefile.
xy_opts	List of xy data options for xy (e.g., xy_opts = list(xvar='LON', yvar='LAT'). See xy_options() for more options and defaults.
datsource	String. Source of FIA data for defining FIA evaluations or appending variables ('datamart', 'sqlite', 'obj', 'csv'). If datsource = NULL, datsource = xy_datsource. If datsource = 'datamart', data are downloaded extracted from FIA DataMart (http://apps.fs.usda.gov/fia/datamart/datamart.html). If datsource='sqlite', specify database name(s) in data_dsn and table name(s) in dbTabs() argument. If datsource = ('obj','csv'), specify *.csv file name in dbTabs argument.
data_dsn	String. Name of database with plot_layer and/or ppsa_layer.
dbTabs	String or R Object. If data_dsn = 'datamart', name of table(s) in FIA DataMart. If data_dsn = 'sqlite', name of layer(s) in database. If datsource = 'csv', name of CSV file(s). If datsource = 'obj', name of R object.
pjoinid	String. Variable in plot table to join to XY data, if plot_layer is not NULL. Not necessary to be unique. If using most current XY coordinates, use identifier for a plot (e.g., PLOT_ID).
eval	String. Type of evaluation time frame for data extraction ('FIA', 'custom'). See eval_opts for more further options.
eval_opts	List of evaluation options for 'FIA' or 'custom' evaluations to determine the set of data returned. See help(eval_options) for a list of options.
invtype	String. Type of FIA inventory to extract ('PERIODIC', 'ANNUAL'). Only one inventory type (PERIODIC/ANNUAL) at a time.
coordType	String. c('PUBLIC', 'ACTUAL'). Defines type of coordinates and is used for the output name.
intensity1	Logical. If TRUE, includes only XY coordinates where INTENSITY = 1 (FIA base grid).
pvars2keep	String vector. One or more variables in plot_layer to append to output.
issp	Logical. If TRUE, returns spatial XY data as a list object with query.
returndata	Logical. If TRUE, returns XY data as a list object with query.
savedata	Logical. If TRUE, saves XY data. Specify outfolder and format using savedata_opts.
exportsp	Logical. If TRUE, exports data as spatial.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE or exportsp = TRUE.

PLOT	Data frame. The name of the PLOT data frame object if it is already downloaded and stored in environment.
POP_PLOT_STRATUM_ASSGN	Data frame. The name of the POP_PLOT_STRATUM_ASSGN data frame object if it is already downloaded and stored in environment.
SURVEY	Data frame. The name of the SURVEY data frame object if it has been already downloaded and stored in environment.
dbconnopen	Logical. If TRUE, the dbconn connection is not closed.
evalInfo	List. List object output from DBgetEvalid or DBgetXY FIESTA functions.

Value

if returndata=TRUE, a list of the following objects:

xy	Data frame. XY data from database. The output name is based on coordType parameter (e.g., xy_PUBLIC). the data frame include xy.uniqueid, xvar, yvar and appended plot variables in pvars2keep if plot_layer is not NULL. The default plot variables included are 'STATECD','UNITCD','COUNTYCD', 'PLOT','PLOT_ID' (ID+STATECD+UNTCD+COUNTYCD+PLOT), 'COUNTYFIPS'. If issp=TRUE, returns an sf object.
xyqry	String. Query to extract coordinates.
xvar	String. Name of X variable in xy*.
yvar	String. Name of Y variable in xy*.

If savedata=TRUE, outputs the xy* based on savedata_opts. If exportsp=TRUE, the output xy saved as spatial layer based on savedata_opts.

Note

If no parameters are included, the user is prompted for input. If partial parameters, the default parameter values are used for those not specified.

Examples

```
## Not run:
# Most current evaluation and shapefile with public coordinates
COxylst <- DBgetXY(states = "Colorado",
                   eval = "FIA",
                   eval_opts=eval_options(Endyr = 2019))
names(COxylst)

head(COxylst$xy_PUBLIC)
COxylst$xyqry

## End(Not run)
```

DBqryCSV *Database - Queries FIA Online Database.*

Description

Downloads, extracts, and queries compressed comma-delimited file(s) (*.zip) from FIA DataMart (https://apps.fs.usda.gov/fia/datamart/CSV/datamart_csv.html). (Note: must use SQL syntax).

Usage

```
DBqryCSV(sql, states = NULL, sqltables = NULL)
```

Arguments

sql	String. A sql query. Must be appropriate sql syntax.
states	String vector. Name of state(s) in query. If not by state, set to NULL.
sqltables	String vector. Name of table(s) in sql statement to download. The sqltables must match tables in the sql statement (i.e., case-sensitive).

Details

The compressed data files are downloaded from FIA DataMart; saved to a temporary space; extracted and imported; and deleted from temporary space. Accessibility and download time depends on access and speed of internet connection.

Value

Returns a data frame from resulting query.

Author(s)

Tracey S. Frescino

Examples

```
## Not run:
# Number of plots by inventory year for the state of Wyoming
sql <- "select INVYR, count(*) AS NBRPLOTS
        from plot
        where statecd=56 group by INVYR"
DBqryCSV(sql = sql,
         states = "Wyoming",
         sqltables = "plot")

## End(Not run)
```

dbTables *List of population tables.*

Description

Returns a list of user-supplied parameters and parameter values for data tables to be supplied to *DB functions.

Usage

```
dbTables(
  plot_layer = "PLOT",
  cond_layer = "COND",
  tree_layer = "TREE",
  seed_layer = "SEEDLING",
  plotgeom_layer = "PLOTGEOM",
  vsubpspp_layer = "P2VEG_SUBPLOT_SPP",
  vsubpstr_layer = "P2VEG_SUBP_STRUCTURE",
  invsubp_layer = "INVASIVE_SUBPLOT_SPP",
  subplot_layer = "SUBPLOT",
  subpcond_layer = "SUBP_COND",
  dwm_layer = "COND_DWM_CALC",
  sccm_layer = "SUBP_COND_CHNG_MTRX",
  grm_layer = "TREE_GRM_COMPONENT",
  grmb_layer = "TREE_GRM_BEGIN",
  grmm_layer = "TREE_GRM_MIDPT",
  survey_layer = "SURVEY",
  popeval_layer = "POP_EVAL",
  popevalgrp_layer = "POP_EVAL_GRP",
  popevaltyp_layer = "POP_EVAL_TYP",
  popstratum_layer = "POP_STRATUM",
  popestnunit_layer = "POP_ESTN_UNIT",
  ppsa_layer = "POP_PLOT_STRATUM_ASSGN",
  refspp_layer = "REF_SPECIES",
  other_layers = NULL,
  ...
)
```

Arguments

plot_layer	R object, comma-delimited file(*.csv), or name of layer in database. Plot-level data (PLOT).
cond_layer	R object, comma-delimited file(*.csv), or name of layer in database. Condition-level data (COND).
tree_layer	R object, comma-delimited file(*.csv), or name of layer in database. Tree-level data (TREE).

seed_layer R object, comma-delimited file(*.csv), or name of layer in database. Seedling data (SEEDLING).

plotgeom_layer R object, comma-delimited file(*.csv), or name of layer in database. Plot-level GIS extracted data (PLOTGEOM).

vsubpspp_layer R object, comma-delimited file(*.csv), or name of layer in database. Understory vegetation species data (P2VEG_SUBPLOT_SPP).

vsubpstr_layer R object, comma-delimited file(*.csv), or name of layer in database. Understory vegetation structure data (P2VEG_SUBP_STRUCTURE).

invsubp_layer R object, comma-delimited file(*.csv), or name of layer in database. Understory vegetation invasives data (INVASIVE_SUBPLOT_SPP).

subplot_layer R object, comma-delimited file(*.csv), or name of layer in database. Subplot-level data (SUBPLOT).

subpcond_layer R object, comma-delimited file(*.csv), or name of layer in database. Subplot condition-level data (SUBP_COND).

dwm_layer R object, comma-delimited file(*.csv), or name of layer in database. Down wood material data (COND_DWM_CALC)

sccm_layer R object, comma-delimited file(*.csv), or name of layer in database. Subplot-level change matrix data (SUBP_COND_CHNG_MTRX).

grm_layer R object, comma-delimited file(*.csv), or name of layer in database. Tree growth, removal, mortality data (TREE_GRM_COMPONENT).

grmb_layer R object, comma-delimited file(*.csv), or name of layer in database. Tree growth, removal, mortality begin data (TREE_GRM_BEGIN).

grmm_layer R object, comma-delimited file(*.csv), or name of layer in database. Tree growth, removal, mortality midpoint data (TREE_GRM_MIDPT).

survey_layer R object, comma-delimited file(*.csv), or name of layer in database. Population survey (SURVEY) data.

popeval_layer R object, comma-delimited file(*.csv), or name of layer in database. Population evaluation (POP_EVAL) data.

popevalgrp_layer
R object, comma-delimited file(*.csv), or name of layer in database. Population evaluation group data (POP_EVAL_GRP).

popevaltyp_layer
R object, comma-delimited file(*.csv), or name of layer in database. Population evaluation type data (POP_EVAL_TYP).

popstratum_layer
R object, comma-delimited file(*.csv), or name of layer in database. Population stratum data (POP_STRATUM).

popestnunit_layer
R object, comma-delimited file(*.csv), or name of layer in database. Population estimation unit data (POP_ESTN_UNIT).

ppsa_layer R object, comma-delimited file(*.csv), or name of layer in database. Population plot stratum assignment data ((POP_PLOT_STRATUM_ASSGN).

refspp_layer R object, comma-delimited file(*.csv), or name of layer in database. Reference table for species (REF_SPECIES).

other_layers	String. Other layer(s) in database to clip and/or extract from database (Note: must include PLT_CN variable as unique identifier).
...	For extendibility.

Details

If no parameters, an empty list is returned.

Value

A list of user-supplied parameters and parameter values for strata.

Author(s)

Tracey S. Frescino

Examples

```
dbTables(plot_layer = FIESTA::WYplt)
```

GDT_NAMES *Reference tables - gdal data types.*

Description

Reference tables - gdal data types.

Usage

```
GDT_NAMES
```

Format

An object of class `character` of length 12.

Source

gdal values.

kindcd3old *Reference table - List of RMRS plots that have fallen out of inventory because they were not found or they were in the wrong place.*

Description

Reference table - List of RMRS plots that have fallen out of inventory because they were not found or they were in the wrong place.

Usage

```
kindcd3old
```

Format

An object of class `data.frame` with 38 rows and 8 columns.

Source

FIA query. SELECT bp.STATECD, bp.COUNTYCD, bp.PLOT_FIADB NEW_PLOT, bp.START_DATE NEW_START_DATE, bp_old.COUNTYCD OLD_COUNTYCD, bp_old.PLOT_FIADB OLD_PLOT, bp_old.END_DATE OLD_END_DATE, p.CN FROM fs_nims_rmrs.NIMS_BASE_PLOT bp JOIN fs_nims_rmrs.NIMS_BASE_PLOT bp_old on (bp.PREV_NBP_CN=bp_old.CN) JOIN fs_nims_rmrs.NIMS_PLOT_RMRS_ p on(p.NBP_CN=bp_old.CN) WHERE p.KINDCD = 1 ORDER BY bp.STATECD, bp.COUNTYCD, bp_old.PLOT_FIADB"

modGBarea *Green-Book module - Generate area estimates.*

Description

Generates area estimates by domain (and estimation unit). Calculations are based on Scott et al. 2005 ('the green-book') for mapped forest inventory plots. The non-ratio estimator for estimating area by stratum and domain is used. Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. The attribute is the proportion of the plot which is divided by the adjustment factor, and averaged by stratum. Strata means are combined using the strata weights and then expanded to area using the total land area in the population.

Usage

```
modGBarea(
  GBpopdat,
  landarea = "FOREST",
  pcfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  sumunits = TRUE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)
```

Arguments

GBpopdat	List. Population data objects returned from modGBpop().
landarea	String. The sample area filter for estimates ("ALL", "FOREST", "TIMBERLAND"). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
rowvar	String. Name of row domain variable in cond. If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.
colvar	String. Name of column domain variable in cond.
sumunits	Logical. If TRUE, estimation units are summed and returned in one table.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modGBpop() if GBpopdat is NULL.

Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

For available reference tables: sort(unique(FIESTAutils::ref_codes$VARIABLE))

Value

A list with estimates with percent sampling error for rowvar (and colvar). If sumunits=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned. Otherwise, a list object is returned with the following information. If savedata=TRUE, all data frames are written to outfolder.

`est`	Data frame. Area estimates, in area units (e.g., acres), by rowvar, colvar (and estimation unit). If sumunits=TRUE or one estimation unit and colvar=NULL, or allin1=TRUE, estimates and percent sampling error are in one data frame.
`pse`	Data frame. Percent sampling errors (Confidence level 68 for estimates by rowvar and colvar (and estimation unit).
`titlelst`	List. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables. Row and column tables are also included in list.
`raw`	List. If rawdata=TRUE, a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).

Raw data

`plotsampcnt`	Table. Number of plots by plot status (e.g., sampled forest on plot, sampled nonforest, nonsampled).
`condsampcnt`	DF. Number of conditions by condition status (forest land, nonforest land, noncensus water, census water, nonsampled).
`unitarea`	DF. Area by estimation unit.
`expcondtab`	DF. Condition-level area expansion factors.
`domdat`	DF. Final data table used for estimation.
`stratdat`	Data frame. Strata information by estimation unit.

Variable	Description
unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonresponse plots removed
AREA	total area for estimation unit
CONDPROP_ADJFAC	average area

`processing data`

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), colvar totals, if not NULL (unit.colvar); and a combination of rowvar and colvar, if colvar is not NULL (unit.grpvar). If sumunits=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grpest, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

Variable	Description
nhat	estimate proportion of land
nhat.var	variance estimate of estimated proportion of land
NBRPLT.gt0	Number of non-zero plots used in estimates
AREA	total area for estimation unit
est	estimated area of land nhat*areavar
est.var	variance estimate of estimate acres of land nhat.var*areavar^2
est.se	standard error of estimated area of land sqrt(est.var)
est.cv	coefficient of variation of estimated area of land est.se/est
pse	percent sampling error of estimate est.cv*100
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

savedata
if savedata=TRUE...
tables with estimate and percent standard error will be written as *csv files to outfolder. if rawdata=TRUE, the rawdata will be output to the outfolder in a folder named rawdata (if raw_fmt="csv") or a database in the outfolder, if (raw_fmt != "csv").

if outfn.pre is not null...

a prefix is added to output files if raw_fmt = 'csv', prefix is added to file names in rawdata folder if raw_fmt != 'csv', prefix is added to dsn name

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata by summing the unadjusted condition proportions (CONDPROP_UNADJ) and dividing by the number of plots in the strata/estimation unit.

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

STRATA:
Stratification is used to reduce variance in population estimates by partitioning the population into homogenous classes (strata), such as forest and nonforest. For stratified sampling methods, the strata sizes (weights) must be either known or estimated. Remotely-sensed data is often used to generate strata weights with proporation of pixels by strata. If stratification is desired (strata=TRUE), the required data include: stratum assignment for the center location of each plot, stored in either pltassgn or cond; and a look-up table with the area or proportion of the total area of each strata value by estimation unit, making sure the name of the strata (and estimation unit) variable and values match the plot assignment name(s) and value(s).

sumunits:
An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If sumunits=TRUE, estimates are generated by estimation unit, summed together, and returned as one estimate. If rawdata=TRUE, estimates by individual estimation unit are also returned.

If sumunits=FALSE, estimates are generated and returned by estimation unit as one data frame. If savedata=TRUE, a separate file is written for each estimation unit.

stratcombine:
If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

rowlut/collut:
There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:
1-the merging variable with same name as the variable in the input merge table;
2-the ordering or descriptive variable.
If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

modGBchng *Green-Book module - Generate area estimates.*

Description

Generates area estimates by domain (and estimation unit). Calculations are based on Scott et al. 2005 ('the green-book') for mapped forest inventory plots. The non-ratio estimator for estimating area by stratum and domain is used. Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. The attribute is the proportion of the plot which is divided by the adjustment factor, and averaged by stratum. Strata means are combined using the strata weights and then expanded to area using the total land area in the population.

Usage

```
modGBchng(
  GBpopdat,
  chngtype = "total",
  landarea = "FOREST",
  pcfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  sumunits = TRUE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  cdomdat = NULL,
  gui = FALSE,
  ...
)
```

Arguments

GBpopdat	List. Population data objects returned from modGBpop().
chngtype	String. The type of change estimates ('total', 'annual').
landarea	String. The sample area filter for estimates ("ALL", "FOREST", "TIMBERLAND"). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
rowvar	String. Name of row domain variable in cond. If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.

colvar	String. Name of column domain variable in cond.
sumunits	Logical. If TRUE, estimation units are summed and returned in one table.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
cdomdat	Data.frame of condition-domain data. Output from modGBchng().
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modGBpop() if GBpopdat is NULL.

Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (e.g., CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

For available reference tables: sort(unique(FIESTAutils::ref_codes$VARIABLE))

Value

A list with estimates with percent sampling error for rowvar (and colvar). If sumunits=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned. Otherwise, a list object is returned with the following information. If savedata=TRUE, all data frames are written to outfolder.

est	Data frame. Area estimates, in area units (e.g., acres), by rowvar, colvar (and estimation unit). If sumunits=TRUE or one estimation unit and colvar=NULL, or allin1=TRUE, estimates and percent sampling error are in one data frame.
pse	Data frame. Percent sampling errors (Confidence level 68 for estimates by rowvar and colvar (and estimation unit).

`titlelst` List. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables. Row and column tables are also included in list.

`raw` List. If rawdata=TRUE, a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).

Raw data

`plotsampcnt` Table. Number of plots by plot status (e.g., sampled forest on plot, sampled nonforest, nonsampled).

`condsampcnt` DF. Number of conditions by condition status (forest land, nonforest land, non-census water, census water, nonsampled).

`unitarea` DF. Area by estimation unit.

`expcondtab` DF. Condition-level area expansion factors.

`domdat` DF. Final data table used for estimation.

`stratdat` Data frame. Strata information by estimation unit.

Variable	**Description**
unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonresponse plots removed
AREA	total area for estimation unit
CONDPROP_ADJFAC	average area

`processing data`

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), colvar totals, if not NULL (unit.colvar); and a combination of rowvar and colvar, if colvar is not NULL (unit.grpvar). If sumunits=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grpest, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

Variable	**Description**
nhat	estimate proportion of land
nhat.var	variance estimate of estimated proportion of land
NBRPLT.gt0	Number of non-zero plots used in estimates

AREA	total area for estimation unit
est	estimated area of land nhat*areavar
est.var	variance estimate of estimate acres of land nhat.var*areavar^2
est.se	standard error of estimated area of land sqrt(est.var)
est.cv	coefficient of variation of estimated area of land est.se/est
pse	percent sampling error of estimate est.cv*100
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

savedata
if savedata=TRUE...
tables with estimate and percent standard error will be written as *csv files to outfolder. if rawdata=TRUE, the rawdata will be output to the outfolder in a folder named rawdata (if raw_fmt="csv") or a database in the outfolder, if (raw_fmt != "csv").

if outfn.pre is not null...
a prefix is added to output files if raw_fmt = 'csv', prefix is added to file names in rawdata folder if raw_fmt != 'csv', prefix is added to dsn name

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata by summing the unadjusted condition proportions (CONDPROP_UNADJ) and dividing by the number of plots in the strata/estimation unit.

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

STRATA:
Stratification is used to reduce variance in population estimates by partitioning the population into homogenous classes (strata), such as forest and nonforest. For stratified sampling methods, the strata sizes (weights) must be either known or estimated. Remotely-sensed data is often used to generate strata weights with proporation of pixels by strata. If stratification is desired (strata=TRUE), the required data include: stratum assignment for the center location of each plot, stored in either pltassgn or cond; and a look-up table with the area or proportion of the total area of each strata value by estimation unit, making sure the name of the strata (and estimation unit) variable and values match the plot assignment name(s) and value(s).

sumunits:
An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and

variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If sumunits=TRUE, estimates are generated by estimation unit, summed together, and returned as one estimate. If rawdata=TRUE, estimates by individual estimation unit are also returned.

If sumunits=FALSE, estimates are generated and returned by estimation unit as one data frame. If savedata=TRUE, a separate file is written for each estimation unit.

stratcombine:
If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

rowlut/collut:
There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:
1-the merging variable with same name as the variable in the input merge table;
2-the ordering or descriptive variable.
If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

`modGBdwm` *Green-Book module - Generate area estimates.*

Description

Generates area estimates by domain (and estimation unit). Calculations are based on Scott et al. 2005 ('the green-book') for mapped forest inventory plots. The non-ratio estimator for estimating area by stratum and domain is used. Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. The attribute is the proportion of the plot which is divided by the adjustment factor, and averaged by stratum. Strata means are combined using the strata weights and then expanded to area using the total land area in the population.

Usage

```
modGBdwm(
  GBpopdat = NULL,
  dwmtype = "CWD",
  dwmvar = "VOLCF",
  peracre = FALSE,
  lbs2tons = FALSE,
  landarea = "FOREST",
  pcfilter = NULL,
  vfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  sumunits = TRUE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)
```

Arguments

GBpopdat	List. Population data objects returned from modGBpop().
dwmtype	String. Type of dwm estimate ('CWD', 'FWD_LG', "FWD_MD", "FWD_SM").
dwmvar	String. Type of dwm estimate ('VOLCF', 'BIOMASS', "CARBON").
peracre	Logical. If TRUE, generates per-acre estimates.
lbs2tons	Logical. If TRUE, converts biomass or carbon variables from pounds to tons. If metric=TRUE, converts to metric tons, else short tons.
landarea	String. The sample area filter for estimates ("ALL", "FOREST", "TIMBERLAND"). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
vfilter	String. A filter for the P2 vegetation table used for estimate. Must be R logical syntax.

rowvar	String. Name of row domain variable in cond. If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.
colvar	String. Name of column domain variable in cond.
sumunits	Logical. If TRUE, estimation units are summed and returned in one table.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modGBpop() if GBpopdat is NULL.

Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

For available reference tables: sort(unique(FIESTAutils::ref_codes$VARIABLE))

Value

A list with estimates with percent sampling error for rowvar (and colvar). If sumunits=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned. Otherwise, a list object is returned with the following information. If savedata=TRUE, all data frames are written to outfolder.

est	Data frame. Area estimates, in area units (e.g., acres), by rowvar, colvar (and estimation unit). If sumunits=TRUE or one estimation unit and colvar=NULL, or allin1=TRUE, estimates and percent sampling error are in one data frame.

`pse` Data frame. Percent sampling errors (Confidence level 68 unit).

`titlelst` List. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables. Row and column tables are also included in list.

`raw` List. If rawdata=TRUE, a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).

Raw data

`plotsampcnt` Table. Number of plots by plot status (e.g., sampled forest on plot, sampled nonforest, nonsampled).

`condsampcnt` DF. Number of conditions by condition status (forest land, nonforest land, noncensus water, census water, nonsampled).

`unitarea` DF. Area by estimation unit.

`expcondtab` DF. Condition-level area expansion factors.

`domdat` DF. Final data table used for estimation.

`stratdat` Data frame. Strata information by estimation unit.

Variable	**Description**
unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonresponse plots removed
AREA	total area for estimation unit
CONDPROP_ADJFAC	average area

`processing data`

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), colvar totals, if not NULL (unit.colvar); and a combination of rowvar and colvar, if colvar is not NULL (unit.grpvar). If sumunits=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grpest, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

Variable	**Description**
nhat	estimate proportion of land

nhat.var	variance estimate of estimated proportion of land
NBRPLT.gt0	Number of non-zero plots used in estimates
AREA	total area for estimation unit
est	estimated area of land nhat*areavar
est.var	variance estimate of estimate acres of land nhat.var*areavar^2
est.se	standard error of estimated area of land sqrt(est.var)
est.cv	coefficient of variation of estimated area of land est.se/est
pse	percent sampling error of estimate est.cv*100
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

savedata
if savedata=TRUE...
tables with estimate and percent standard error will be written as *csv files to outfolder. if rawdata=TRUE, the rawdata will be output to the outfolder in a folder named rawdata (if raw_fmt="csv") or a database in the outfolder, if (raw_fmt != "csv").

if outfn.pre is not null...
a prefix is added to output files if raw_fmt = 'csv', prefix is added to file names in rawdata folder if raw_fmt != 'csv', prefix is added to dsn name

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata by summing the unadjusted condition proportions (CONDPROP_UNADJ) and dividing by the number of plots in the strata/estimation unit.

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

STRATA:
Stratification is used to reduce variance in population estimates by partitioning the population into homogenous classes (strata), such as forest and nonforest. For stratified sampling methods, the strata sizes (weights) must be either known or estimated. Remotely-sensed data is often used to generate strata weights with proporation of pixels by strata. If stratification is desired (strata=TRUE), the required data include: stratum assignment for the center location of each plot, stored in either pltassgn or cond; and a look-up table with the area or proportion of the total area of each strata value by estimation unit, making sure the name of the strata (and estimation unit) variable and values match the plot assignment name(s) and value(s).

sumunits:
An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation

unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If sumunits=TRUE, estimates are generated by estimation unit, summed together, and returned as one estimate. If rawdata=TRUE, estimates by individual estimation unit are also returned.

If sumunits=FALSE, estimates are generated and returned by estimation unit as one data frame. If savedata=TRUE, a separate file is written for each estimation unit.

stratcombine:
If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

rowlut/collut:
There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:
1-the merging variable with same name as the variable in the input merge table;
2-the ordering or descriptive variable.
If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

`modGBp2veg` *Green-Book module - Generate area estimates.*

Description

Generates area estimates by domain (and estimation unit). Calculations are based on Scott et al. 2005 ('the green-book') for mapped forest inventory plots. The non-ratio estimator for estimating area by stratum and domain is used. Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. The attribute is the proportion of the plot which is divided by the adjustment factor, and averaged by stratum. Strata means are combined using the strata weights and then expanded to area using the total land area in the population.

Usage

```
modGBp2veg(
  GBpopdat = NULL,
  p2vegtype = "str",
  peracre = FALSE,
  landarea = "FOREST",
  pcfilter = NULL,
  vfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  sumunits = TRUE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)
```

Arguments

GBpopdat	List. Population data objects returned from modGBpop().
p2vegtype	String. Type of p2veg estimate ('str', 'spp').
peracre	Logical. If TRUE, generates per-acre estimates.
landarea	String. The sample area filter for estimates ("ALL", "FOREST", "TIMBERLAND"). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
vfilter	String. A filter for the P2 vegetation table used for estimate. Must be R logical syntax.
rowvar	String. Name of row domain variable in cond (e.g., 'FORTYPCD') or P2VEG_SUBP_STRUCTURE (e.g., 'GROWTH_HABIT_CD', 'LAYER') or P2VEG_SUBPLOT_SPP (e.g., 'VEG_FLDSPCD', 'VEG_SPCD', 'GROWTH_HABIT_CD', 'LAYER'). If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.

colvar	String. Name of column domain variable in cond.
sumunits	Logical. If TRUE, estimation units are summed and returned in one table.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modGBpop() if GBpopdat is NULL.

Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

For available reference tables: sort(unique(FIESTAutils::ref_codes$VARIABLE))

Value

A list with estimates with percent sampling error for rowvar (and colvar). If sumunits=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned. Otherwise, a list object is returned with the following information. If savedata=TRUE, all data frames are written to outfolder.

est	Data frame. Area estimates, in area units (e.g., acres), by rowvar, colvar (and estimation unit). If sumunits=TRUE or one estimation unit and colvar=NULL, or allin1=TRUE, estimates and percent sampling error are in one data frame.
pse	Data frame. Percent sampling errors (Confidence level 68 unit).

`titlelst` List. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables. Row and column tables are also included in list.

`raw` List. If rawdata=TRUE, a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).

Raw data

`plotsampcnt` Table. Number of plots by plot status (e.g., sampled forest on plot, sampled nonforest, nonsampled).

`condsampcnt` DF. Number of conditions by condition status (forest land, nonforest land, non-census water, census water, nonsampled).

`unitarea` DF. Area by estimation unit.

`expcondtab` DF. Condition-level area expansion factors.

`domdat` DF. Final data table used for estimation.

`stratdat` Data frame. Strata information by estimation unit.

Variable	**Description**
unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonresponse plots removed
AREA	total area for estimation unit
CONDPROP_ADJFAC	average area

`processing data`

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), colvar totals, if not NULL (unit.colvar); and a combination of rowvar and colvar, if colvar is not NULL (unit.grpvar). If sumunits=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grpest, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

Variable	**Description**
nhat	estimate proportion of land
nhat.var	variance estimate of estimated proportion of land
NBRPLT.gt0	Number of non-zero plots used in estimates

AREA	total area for estimation unit
est	estimated area of land nhat*areavar
est.var	variance estimate of estimate acres of land nhat.var*areavar^2
est.se	standard error of estimated area of land sqrt(est.var)
est.cv	coefficient of variation of estimated area of land est.se/est
pse	percent sampling error of estimate est.cv*100
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

savedata
if savedata=TRUE...
tables with estimate and percent standard error will be written as *csv files to outfolder. if rawdata=TRUE, the rawdata will be output to the outfolder in a folder named rawdata (if raw_fmt="csv") or a database in the outfolder, if (raw_fmt != "csv").

if outfn.pre is not null...
a prefix is added to output files if raw_fmt = 'csv', prefix is added to file names in rawdata folder if raw_fmt != 'csv', prefix is added to dsn name

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata by summing the unadjusted condition proportions (CONDPROP_UNADJ) and dividing by the number of plots in the strata/estimation unit.

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

STRATA:
Stratification is used to reduce variance in population estimates by partitioning the population into homogenous classes (strata), such as forest and nonforest. For stratified sampling methods, the strata sizes (weights) must be either known or estimated. Remotely-sensed data is often used to generate strata weights with proporation of pixels by strata. If stratification is desired (strata=TRUE), the required data include: stratum assignment for the center location of each plot, stored in either pltassgn or cond; and a look-up table with the area or proportion of the total area of each strata value by estimation unit, making sure the name of the strata (and estimation unit) variable and values match the plot assignment name(s) and value(s).

sumunits:
An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and

variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If sumunits=TRUE, estimates are generated by estimation unit, summed together, and returned as one estimate. If rawdata=TRUE, estimates by individual estimation unit are also returned.

If sumunits=FALSE, estimates are generated and returned by estimation unit as one data frame. If savedata=TRUE, a separate file is written for each estimation unit.

stratcombine:
If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

rowlut/collut:
There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:
1-the merging variable with same name as the variable in the input merge table;
2-the ordering or descriptive variable.
If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

modGBpop *Green-Book module - Generate population data for GB module.*

Description

Generates population data for generating 'green-book' estimates (Scott et al. 2005). Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. Attributes adjusted to a per-acre value are summed by plot, divided by the adjustment factor, and averaged by stratum. Strata means are combined using the strata weights and then expanded to using the total land area in the population.

Usage

```
modGBpop(
  popType = "VOL",
  popTabs = popTables(),
  popTabIDs = popTableIDs(),
  popFilter = popFilters(),
  pltassgn = NULL,
  pltassgnid = "PLT_CN",
  dsn = NULL,
  pjoinid = "CN",
  areawt = "CONDPROP_UNADJ",
  areawt2 = NULL,
  adj = "samp",
  defaultVars = TRUE,
  unitvar = NULL,
  unitarea = NULL,
  areavar = "ACRES",
  strata = TRUE,
  stratalut = NULL,
  strvar = "STRATUMCD",
  returndata = TRUE,
  savedata = FALSE,
  saveobj = FALSE,
  objnm = "GBpopdat",
  unit_opts = NULL,
  strata_opts = NULL,
  savedata_opts = NULL,
  GBdata = NULL,
  pltdat = NULL,
  stratdat = NULL,
  auxdat = NULL,
  keepadjvars = FALSE,
  gui = FALSE,
  ...
)
```

Arguments

popType	String. Type of evaluation(s) to include in population data. Note: currently only c('CURR', 'VOL', 'LULC', 'DWM') are available. See details below for descriptions of each.
popTabs	List of population tables the user would like returned. See help(popTables) for a list of options.
popTabIDs	List of unique IDs corresponding to the population tables that the user has requested. See help(popTableIDs) for a list of options.
popFilter	List of population filters. See help(popFilters) for a list of options.
pltassgn	DF/DT, Optional. R object, sf R object, comma-delimited file(.csv), layer or spatial layer in dsn, or shapefile(.shp). Plot-level assignment of estimation unit and/or strata, with one record for each plot.
pltassgnid	String.
dsn	String. Name of database where tree, cond, and plot-level tables reside. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html).
pjoinid	String. Join variable in plot to match pltassgnid. Does not need to be uniqueid. If using most current XY coordinates for plot assignments, use identifier for plot (e.g., PLOT_ID).
areawt	String. Name of variable in cond for summarizing area weights (e.g., CONDPROP_UNADJ).
areawt2	String. An equation to multiply to areawt for estimation. All variables in equation must be in cond. weights (e.g., CONDPROP_UNADJ).
adj	String. How to calculate adjustment factors for nonsampled (nonresponse) conditions based on summed proportions for by plot ('samp', 'plot'). 'samp' - adjustments are calculated at strata/estimation unit level; 'plot' - adjustments are calculated at plot-level. Adjustments are only calculated for annual inventory plots (DESIGNCD=1).
defaultVars	Logical. If TRUE, a set of default variables are selected.
unitvar	String. Name of the estimation unit variable in unitarea and cond or pltassgn data frame with estimation unit assignment for each plot (e.g., 'ESTN_UNIT'). Optional if only one estimation unit.
unitarea	Numeric or DF. Total area by estimation unit. If only 1 estimation unit, include number of total acreage for the area of interest or a data frame with area and estimation unit. If more than one estimation unit, provide a data frame of total area by estimation unit, including unitvar and areavar.
areavar	String. Name of area variable in unitarea. Default="ACRES".
strata	Logical. If TRUE, include information for post-stratification.
stratalut	DF/DT. If strata=TRUE, look-up table with pixel counts or area by strata or proportion or area ('strwt') by strata (and estimation unit). If 'strwt' is not included, set getwt=TRUE and getwtvar as the name of variable to calculate weights from (e.g., pixel counts).
strvar	String. If strata=TRUE, name of the strata variable in stratalut and cond or pltassgn data frame with stratum assignment for each plot (Default = 'STRATUMCD').

returndata	Logical. If TRUE, returns data objects.
savedata	Logical. If TRUE, saves table(s) to outfolder.
saveobj	Logical. If TRUE, saves returned list object to outfolder.
objnm	String. Name of *.rds object.
unit_opts	List. See help(unit_options()) for a list of options.
strata_opts	List. See help(strata_options()) for a list of options. Only used when strata = TRUE.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
GBdata	R List object. Output data list components from FIESTA::anGBdata().
pltdat	R List object. Output data list components from FIESTA::spGetPlots().
stratdat	R List object. Output data list components from FIESTA::spGetStrata().
auxdat	R List object. Output data list components from FIESTA::spGetAuxiliary().
keepadjvars	Logical. If TRUE, keep adjustment factors from pop_stratum table in FIA database.
gui	Logical. If gui, user is prompted for parameters.
...	For extendibility.

Details

Population types

popType	Description
ALL	Population data, including nonsampled plots.
CURR	Population data for area estimates, excluding nonsampled plots.
VOL	Population data for area/tree estimates, excluding nonsampled plots.
LULC	Population data for land use/land cover transitional estimates, including only plots with previous n

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot in tree table.
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	TPA_UNADJ	Number of trees per acre each sample tree represents (e.g., DESIGNCD=1: TPA_U
cond	cuniqueid	Unique identifier for each plot in cond table.
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.

	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on eacl
pltassgn	pltassgnid	Unique identifier for each plot in pltassgn.
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

For available reference tables: sort(unique(FIESTAutils::ref_codes$VARIABLE))

Value

A list with population data for Green-Book estimates.

`condx`	Data frame. Condition-level data including plot-level assignment of estimation unit and stratum (if strata=TRUE), condition proportion adjustment factor (cadjfac), and adjusted condition proportions (CONDPROP_ADJ).
`cuniqueid`	String. Unique identifier of plot in condx and pltcondx.
`condid`	String. Unique identifier of condition in condx and pltcondx.
`treex`	Data frame. Tree data within population, used for estimation, including trees per acre adjustment factor (tadjfac), and adjusted trees per acre (TPA_ADJ) (if treef is included).
`tuniqueid`	String. Unique identifier of plot in treex (if treef is included).
`ACI.filter`	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1".
`unitarea`	String. Returned table of area by estimation unit.
`unitvar`	String. Variable name for estimation unit.
`strlut`	String. Strata-level table with pixel counts by strata (P1POINTCNT), strata weights (strwt), number of plots by strata (n.strata), total number of plots in estimation unit (n.total), sum of condition proportions (_UNADJ_SUM), area adjustments (*_ADJFAC), total area, and area expansion by strata (EXPNS).
`strvar`	String. Variable name for strata. If strata=FALSE, strvar="ONESTRAT".
`expcondtab`	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1".
`plotsampcnt`	Data frame. Number of plots by PLOT_STATUS_CD.
`condsampcnt`	Data frame. Number of conditions by COND_STATUS_CD.
`states`	String. State names in dataset.
`invyrs`	String. Range of inventory years in dataset.
`stratdat`	Data frame. Strata information by estimation unit.

Variable	**Description**
unitvar	estimation unit

strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (i.e., strata weight)
CONDPROP_UNADJ_SUM	summed conditionproportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonsampled plots removed
AREA_USED	total area of estimation unit
expfac	strata-level expansion factor after nonsampled plots and conditions removed (AREA_USEI
EXPNS	strata-level area expansions (expfac * strwt)

Table(s) are also written to outfolder.

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. *PROP_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

unitcombine:
If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

stratcombine:
If TRUE and less than 2 plots in any one strata class within an estimation unit, all strata classes with 2 or less plots are combined. The current method for combining is to group the strata with less than 2 plots with the strata class following in consecutive order (numeric or alphabetical), restrained by estimation unit (if unitcombine=FALSE), and continuing until the number of plots equals 10. If there are no strata classes following in order, it is combined with the estimation unit previous in order.

unitarea = FIESTA::WYunitarea,
unitvar = "ESTN_UNIT",
strata = TRUE,
stratalut = WYstratalut,
strata_opts = strata_options(getwt = TRUE)
)

str(GBpopdat, max.level = 1)
```

---

modGBratio *Green-Book module - Generate ratio estimates.*

Description

Generates per-acre and per-tree estimates by domain and/or tree domain (and estimation unit). Calculations are based on chapter 4 of Scott et al. 2005 ('the green-book') for mapped forest inventory plots. The ratio estimator for estimating per-acre or per-tree by stratum and domain is used, referred to as Ratio of Means (ROM).

Usage

```
modGBratio(
  GBpopdat,
  estseed = "none",
  ratiotype = "PERACRE",
  woodland = "Y",
```

```
  landarea = "FOREST",
  pcfilter = NULL,
  estvarn = NULL,
  estvarn.filter = NULL,
  estvard = NULL,
  estvard.filter = NULL,
  rowvar = NULL,
  colvar = NULL,
  sumunits = TRUE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)
```

Arguments

GBpopdat	List. Population data objects returned from modGBpop().
estseed	String. Use seedling data only or add to tree data. Seedling estimates are only for counts (estvar='TPA_UNADJ')-('none', 'only', 'add').
ratiotype	String. The type of ratio estimates ("PERACRE", "PERTREE").
woodland	String. If woodland = 'Y', include woodland tree species where measured. If woodland = 'N', only include timber species. See FIESTA::ref_species$WOODLAND ='Y/N'. If woodland = 'only', only include woodland species.
landarea	String. The sample area filter for estimates ("FOREST", "TIMBERLAND"). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
estvarn	String. Name of the tree estimate variable (numerator).
estvarn.filter	String. A tree filter for the estimate variable (numerator). Must be R syntax (e.g., "STATUSCD == 1").
estvard	String. Name of the tree estimate variable (denominator).
estvard.filter	String. A tree filter for the estimate variable (denominator). Must be R syntax (e.g., "STATUSCD == 1").
rowvar	String. Name of the row domain variable in cond or tree. If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.
colvar	String. Name of the column domain variable in cond or tree.
sumunits	Logical. If TRUE, estimation units are summed and returned in one table.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.

table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modGBpop() if GBpopdat is NULL.

Details

If variable = NULL, then it will prompt user for input.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if onl
	TPA_UNADJ	Number of trees per acre each sample tree represents (ex. DESIGNCD=1: TPA_U
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on eacl
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

For available reference tables: sort(unique(FIESTAutils::ref_codes$VARIABLE))

Value

A list with estimates with percent sampling error for rowvar (and colvar). If sumunits=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned. Otherwise, a list object is returned with the following information. If savedata=TRUE, all data frames are written to outfolder.

est	Data frame. Tree estimates by rowvar, colvar (and estimation unit). If sumunits=TRUE or one estimation unit and colvar=NULL, estimates and percent sampling error are in one data frame.
pse	Data frame. Percent sampling errors (Confidence level 68 colvar (and estimation unit). Note: for 95 percent sampling error by 1.96.

`titlelst` List with 1 or 2 string vectors. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables.

`raw` List of data frames. If rawdata=TRUE, a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).

Raw data

`plotsampcnt` Table. Number of plots by plot status (ex. sampled forest on plot, sampled nonforest, nonsampled).

`condsampcnt` DF. Number of conditions by condition status (forest land, nonforest land, noncensus water, census water, nonsampled).

`unitarea` DF. Area by estimation unit.

`expcondtab` DF. Condition-level area expansion factors.

`tdomdat` DF. Final data table used for estimation.

`stratdat` Data frame. Strata information by estimation unit.

Variable	Description
unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (i.e., strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonsampled plots removed

`processing data`

Data frames. Separate data frames of variables used in estimation process for the rowvar, colvar and combination of rowvar and colvar (if colvar is not NULL), and grand total by estimation unit (unit.rowest, unit.colest, unit.grpest, unit.totest, respectively) and summed estimation units, if sumunits=TRUE (roweset, colest, grpest, totest, respectively).

The data frames include the following information:

Variable	Description
nhat	estimated proportion of trees for numerator
nhat.var	variance estimate of estimated proportion of trees for numerator
dhat	estimated proportion of trees for denominator
dhat.var	variance estimate of estimated proportion of trees for denominator
covar	covariance for ratio
NBRPLT.gt0	Number of non-zero plots used in estimates
ACRES	total area for estimation unit
estn	estimated area of trees, for numerator nhat*ACRES

estn.var	variance estimate of estimated area of trees nhat.var*areavar^2
estd	estimated area of land (ratiotype="PERACRE"), for denominator dhat*areavar
estd.var	variance of estimated area, for denominator dhat.var*areavar^2
estd.covar	estimated covariance of numerator and denominator covar*areavar^2
rhat	estimated ratio estn/estd
rhat.var	variance estimate of estimation ratio estn.var+rhat^2*estd.var-2*rhat*est.covar)/estd^2
rhat.se	estimated standard error of ratio sqrt(rhat.var)
rhat.cv	estimated coefficient of variation of ratio rhat.se/rhat
rhat.pse	estimated percent standard error or ratio rhat.cv*100
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

Table(s) are also written to outfolder.

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. *PROP_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

STRATA:
Stratification is used to reduce variance in population estimates by partitioning the population into homogenous classes (strata), such as forest and nonforest. For stratified sampling methods, the strata sizes (weights) must be either known or estimated. Remotely-sensed data is often used to generate strata weights with proporation of pixels by strata. If stratification is desired (strata=TRUE), the required data include: stratum assignment for the center location of each plot, stored in either pltassgn or cond; and a look-up table with the area or proportion of the total area of each strata value by estimation unit, making sure the name of the strata (and estimation unit) variable and values match the plot assignment name(s) and value(s).

sumunits:
An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If sumunits=TRUE, estimates are generated by estimation unit, summed together, and returned as one estimate. If rawdata=TRUE, estimates by individual estimation unit are also returned.

If sumunits=FALSE, estimates are generated and returned by estimation unit as one data frame. If savedata=TRUE, a separate file is written for each estimation unit.

stratcombine:
If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

rowlut/collut:
There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:
1-the merging variable with same name as the variable in the input merge table;
2-the ordering or descriptive variable.
If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

UNITS:
The following variables are converted from pounds (in NIMS) to short tons by multiplying the variable by 0.0005. DRYBIO_AG, DRYBIO_BG, DRYBIO_WDLD_SPP, DRYBIO_SAPLING, DRYBIO_STUMP, DRYBIO_TOP, DRYBIO_BOLE, DRYBIOT, DRYBIOM, DRYBIOTB, JBIOTOT, CARBON_BG, CARBON_AG

MORTALITY:
For Interior-West FIA, mortality estimates are mainly based on whether a tree has died within the last 5 years of when the plot was measured. If a plot was remeasured, mortality includes trees that were alive the previous visit but were dead in the next visit. If a tree was standing the previous visit, but was not standing in the next visit, no diameter was collected (DIA = NA) but the tree is defined as mortality.

Common tree filters:

FILTER	DESCRIPTION

"STATUSCD == 1"	Live trees
"STATUSCD == 2"	Dead trees
"TPAMORT_UNADJ > 0"	Mortality trees
"STATUSCD == 2 & DIA >= 5.0"	Dead trees >= 5.0 inches diameter
"STATUSCD == 2 & AGENTCD == 30"	Dead trees from fire

---

modGBtree *Green-Book module - Generate tree estimates.*

Description

Generates tree and or seedling estimates by domain and/or tree domain (and estimation unit). Calculations are based on Scott et al. 2005 ('the green-book') for mapped forest inventory plots. The non-ratio estimator for estimating tree attributes by stratum and domain is used. Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. Attributes adjusted to a per-acre value are summed by plot, divided by the adjustment factor, and averaged by stratum. Strata means are combined using the strata weights and then expanded to using the total land area in the population.

Usage

```
modGBtree(
  GBpopdat,
  estvar,
  estvar.filter = NULL,
  estseed = "none",
  woodland = "Y",
  landarea = "FOREST",
  pcfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  sumunits = TRUE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)
```

Arguments

GBpopdat	List. Population data objects returned from FIESTA::modGBpop().
estvar	String. Name of the tree-level estimate variable (e.g., 'VOLCFNET').

estvar.filter	String. A tree-level filter for estvar. Must be R syntax (e.g., 'STATUSCD == 1').
estseed	String. Use seedling data only or add to tree data. Seedling estimates are only for counts (estvar='TPA_UNADJ')-('none', 'only', 'add').
woodland	String. If woodland = 'Y', include woodland tree species where measured. If woodland = 'N', only include timber species. See FIESTA::ref_species$WOODLAND ='Y/N'. If woodland = 'only', only include woodland species.
landarea	String. The condition-level filter for defining land area ('ALL', 'FOREST', 'TIMBERLAND'). If landarea='FOREST', COND_STATUS_CD = 1; if landarea='TIMBERLAND', SITECLCD in(1:6) & RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
rowvar	String. Optional. Name of domain variable to group estvar by for rows in table output. Rowvar must be included in an input data frame (i.e., plt, cond, tree). If no rowvar is included, an estimate is returned for the total estimation unit. Include colvar for grouping by 2 variables.
colvar	String. Optional. If rowvar != NULL, name of domain variable to group estvar by for columns in table output. Colvar must be included in an input data frame (i.e., plt, cond, tree).
sumunits	Logical. If TRUE, estimation units are summed and returned in one table.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modGBpop() if GBpopdat is NULL.

Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if onl
	TPA_UNADJ	Number of trees per acre each sample tree represents (ex. DESIGNCD=1: TPA_U
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identfier of each condition on plot. Set CONDID=1, if only 1 condition per
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest

	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on eacl
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

For available reference tables: sort(unique(FIESTAutils::ref_codes$VARIABLE))

Value

A list with estimates with percent sampling error for rowvar (and colvar). If sumunits=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned. Otherwise, a list object is returned with the following information. If savedata=TRUE, all data frames are written to outfolder.

`est`	Data frame. Tree estimates by rowvar, colvar (and estimation unit). If sumunits=TRUE or one estimation unit and colvar=NULL, estimates and percent sampling error are in one data frame.
`pse`	Data frame. Percent sampling errors (Confidence level 68 colvar (and estimation unit). Note: for 95 percent sampling error by 1.96.
`titlelst`	List with 1 or 2 string vectors. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables.
`raw`	List of data frames. If rawdata=TRUE, a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).

Raw data

`plotsampcnt`	Table. Number of plots by plot status (ex. sampled forest on plot, sampled nonforest, nonsampled).
`condsampcnt`	DF. Number of conditions by condition status (forest land, nonforest land, noncensus water, census water, nonsampled).
`unitarea`	DF. Area by estimation unit.
`expcondtab`	DF. Condition-level area expansion factors.
`tdomdat`	DF. Final data table used for estimation.
`stratdat`	Data frame. Strata information by estimation unit.

Variable	**Description**
unitvar	estimation unit

strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (i.e., strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonsampled plots removed

`processing data`

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), and if colvar is not NULL, colvar totals, (unit.colvar); and a combination of rowvar and colvar (unit.grpvar). If sumunits=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grpest, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

Variable	**Description**
nhat	estimated proportion of trees
nhat.var	variance estimate of estimated proportion of trees
NBRPLT.gt0	Number of non-zero plots used in estimates
ACRES	total area for estimation unit
est	estimated area of trees nhat*ACRES
est.var	variance estimate of estimated area of trees nhat.var*areavar^2
est.se	standard error of estimated area of trees sqrt(est.var)
est.cv	coefficient of variation of estimated area of trees est.se/est
pse	percent sampling error of estimate est.cv*100
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

Table(s) are also written to outfolder.

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. *PROP_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

sumunits:
An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If sumunits=TRUE, estimates are generated by estimation unit, summed together, and returned as one estimate. If rawdata=TRUE, estimates by individual estimation unit are also returned.

If sumunits=FALSE, estimates are generated and returned by estimation unit as one data frame. If savedata=TRUE, a separate file is written for each estimation unit.

stratcombine:
If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

rowlut/collut:
There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:
1-the merging variable with same name as the variable in the input merge table;
2-the ordering or descriptive variable.
If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

UNITS:
The following variables are converted from pounds (from FIA database) to short tons by multiplying the variable by 0.0005. DRYBIO_AG, DRYBIO_BG, DRYBIO_WDLD_SPP, DRYBIO_SAPLING, DRYBIO_STUMP, DRYBIO_TOP, DRYBIO_BOLE, DRYBIOT, DRYBIOM, DRYBIOTB, JBIOTOT, CARBON_BG, CARBON_AG

MORTALITY:
For Interior-West FIA, mortality estimates are mainly based on whether a tree has died within the last 5 years of when the plot was measured. If a plot was remeasured, mortality includes trees that were alive the previous visit but were dead in the next visit. If a tree was standing the previous visit, but was not standing in the next visit, no diameter was collected (DIA = NA) but the tree is defined as mortality.

Common tree filters:

FILTER	DESCRIPTION
"STATUSCD == 1"	Live trees
"STATUSCD == 2"	Dead trees
"TPAMORT_UNADJ > 0"	Mortality trees
"STATUSCD == 2 & DIA >= 5.0"	Dead trees >= 5.0 inches diameter
"STATUSCD == 2 & AGENTCD == 30"	Dead trees from fire

modMAarea *Model-Assisted module - Generate model-assisted area estimates.*

Description

Generates area estimates by estimation unit. Estimates are calculated from McConville et al. (2018)'s mase R package.

Usage

```
modMAarea(
  MApopdat,
  MAmethod,
  FIA = TRUE,
  prednames = NULL,
  modelselect = FALSE,
  landarea = "FOREST",
  pcfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  bootstrap = FALSE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  modelselect_bydomain = FALSE,
  ...
)
```

Arguments

MApopdat	List. Population data objects returned from modMApop().
MAmethod	String. mase (i.e., model-assisted) method to use ('greg', 'gregEN', 'ratio').
FIA	Logical. If TRUE, the finite population term is removed from estimator to match FIA estimates.
prednames	String vector. Name(s) of predictor variables to include in model.
modelselect	Logical. If TRUE, an elastic net regression model is fit to the entire plot level data, and the variables selected in that model are used for the proceeding estimation.
landarea	String. The sample area filter for estimates ('ALL', 'FOREST', 'TIMBERLAND'). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
rowvar	String. Name of the row domain variable in cond or tree. If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.
colvar	String. Name of the column domain variable in cond or tree.
bootstrap	Logical. If TRUE, returns bootstrap variance estimates, otherwise uses Horvitz-Thompson estimator under simple random sampling without replacement.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
modelselect_bydomain	Logical. If TRUE, modelselection will occur at the domain level as specified by rowvar and/or colvar and not at the level of the entire sample.
...	Parameters for modMApop() if MApopdat is NULL.

Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltstrat (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if only
cond	cuniqueid	Unique identifier for each plot, to link to pltstrat (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition per

	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if or
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, etc
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest,
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
pltstrat	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assumed

Reference names are available for the following variables:
ADFORCD, AGENTCD, CCLCD, DECAYCD, DSTRBCD, KINDCD, OWNCD, OWNGRPCD, FORTYPCD, FLDTYPCD, FORTYPCDCALC, TYPGRPCD, FORINDCD, RESERVCD, LANDCLCD, STDSZCD, FLDSZCD, PHYSCLCD, MIST_CL_CD, PLOT_STATUS_CD, STATECD, TREECLCD, TRTCD, SPCD, SPGRPCD

Value

If FIA=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned with tree estimates and percent sample errors. Otherwise, a list is returned with tree estimates in one data frame (est) and percent sample errors in another data frame (est.pse). If rawdata=TRUE, another list is returned including raw data used in the estimation process. If addtitle=TRUE and returntitle=TRUE, the title for est/pse is returned. If savedata=TRUE, all data frames are written to outfolder.

`est`	Data frame. Tree estimates by rowvar, colvar (and estimation unit). If FIA=TRUE or one estimation unit and colvar=NULL, estimates and percent sampling error are in one data frame.
`pse`	Data frame. Percent sampling errors for estimates by rowvar and colvar (and estimation unit).
`titlelst`	List with 1 or 2 string vectors. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables.
`raw`	List of data frames. If rawdata=TRUE, a list including: number of plots by plot status, if in dataset (plotsampcnt); number of conditions by condition status (condsampcnt); data used for post-stratification (stratdat); and 1-8 tables with calculated variables used for processing estimates and percent sampling error for table cell values and totals (See processing data below).

Raw data

`plotsampcnt`	Table. Number of plots by plot status (ex. sampled forest on plot, sampled nonforest, nonsampled).
`condsampcnt`	DF. Number of conditions by condition status (forest land, nonforest land, noncensus water, census water, nonsampled).
`stratdat`	Data frame. Strata information by estimation unit.

Variable	Description
ESTUNIT	estimation unit
STRATA	strata
ACRES	area by strata for estimation unit
n.strata	number of plots in strata (and estimation unit)
n.total	number of plots for estimation unit
TOTACRES	total area for estimation unit
strwt	proportion of area (or number of plots) by strata (strata weight)
expfac.strata	expansion factor (in area unit (e.g., acres) by strata (areavar/n.strata)

`processing data`

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), and if colvar is not NULL, colvar totals, (unit.colvar); and a combination of rowvar and colvar (unit.grpvar). If FIA=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grpest, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

Variable	Description
nhat	estimated proportion of trees
nhat.var	estimated variance of estimated proportion of trees
ACRES	total area for estimation unit
est	estimated area of trees nhat*ACRES
est.var	estimated variance of estimated area of trees nhat.var*areavar^2
est.se	standard error of estimated area of trees sqrt(est.var)
est.cv	coefficient of variation of estimated area of trees est.se/est
pse	percent sampling error of estimate est.cv*100
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

Table(s) are also written to outfolder.

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. *PROP_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

stratcombine:
If MAmethod='PS', and stratcombine=TRUE, and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

autoxreduce:
If MAmethod='GREG', and autoxreduce=TRUE, and there is an error because of multicolinearity, a variable reduction method is applied to remove correlated variables. The method used is based on the variance-inflation factor (vif) from a linear model. The vif estimates how much the variance of each x variable is inflated due to mulitcolinearity in the model.

rowlut/collut:
There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:
1-the merging variable with same name as the variable in the input merge table;
2-the ordering or descriptive variable.
If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

UNITS:
The following variables are converted from pounds (from FIA database) to short tons by multiplying the variable by 0.0005. DRYBIO_AG, DRYBIO_BG, DRYBIO_WDLD_SPP, DRYBIO_SAPLING, DRYBIO_STUMP, DRYBIO_TOP, DRYBIO_BOLE, DRYBIOT, DRYBIOM, DRYBIOTB, JBIOTOT, CARBON_BG, CARBON_AG

MORTALITY:
For Interior-West FIA, mortality estimates are mainly based on whether a tree has died within the last 5 years of when the plot was measured. If a plot was remeasured, mortality includes trees that were alive the previous visit but were dead in the next visit. If a tree was standing the previous visit, but was not standing in the next visit, no diameter was collected (DIA = NA) but the tree is defined as mortality.

Common tree filters:

FILTER	DESCRIPTION
"STATUSCD == 1"	Live trees
"STATUSCD == 2"	Dead trees
"TPAMORT_UNADJ > 0"	Mortality trees
"STATUSCD == 2 & DIA >= 5.0"	Dead trees >= 5.0 inches diameter
"STATUSCD == 2 & AGENTCD == 30"	Dead trees from fire

          colvar = "STDSZCD")

str(mod2)
```

modMApop *Model-Assisted module - Generate population data for MA module.*

Description

Generates population data for generating model-assisted estimation. Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata (if MAmethod="PS") or by estimation unit to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. Attributes adjusted to a per-acre value are summed by plot, divided by the adjustment factor, and averaged by stratum and/or estimation unit. Note: population data must be generated by MA method.

Usage

```
modMApop(
  popType = "VOL",
  popTabs = popTables(),
  popTabIDs = popTableIDs(),
  popFilter = popFilters(),
  pltassgn = NULL,
  pltassgnid = "PLT_CN",
  dsn = NULL,
  pjoinid = "CN",
  areawt = "CONDPROP_UNADJ",
  adjplot = TRUE,
  unitvar = NULL,
  unitarea = NULL,
  areavar = "ACRES",
  unitzonal = NULL,
  prednames = NULL,
  predfac = NULL,
  standardize = TRUE,
  returndata = TRUE,
  savedata = FALSE,
  saveobj = FALSE,
  objnm = "MApopdat",
  unit_opts = NULL,
  savedata_opts = NULL,
  MAdata = NULL,
  pltdat = NULL,
  auxdat = NULL,
  gui = FALSE,
  ...
)
```

Arguments

popType	String. Type of evaluation(s) to include in population data. Note: currently only c('CURR', 'VOL', 'LULC') are available. See details below for descriptions of each.
popTabs	List of population tables the user would like returned. See help(popTables) for a list of options.
popTabIDs	List of unique IDs corresponding to the population tables that the user has requested. See help(popTableIDs) for a list of options.
popFilter	List of population filters. See help(popFilters) for a list of options.
pltassgn	DF/DT, Optional. R object, sf R object, comma-delimited file(.csv), layer or spatial layer in dsn, or shapefile(.shp). Plot-level assignment of estimation unit and/or strata, with one record for each plot.
pltassgnid	String.
dsn	String. Name of database where tree, cond, and plot-level tables reside. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html).
pjoinid	String. Join variable in plot to match pltassgnid. Does not need to be uniqueid. If using most current XY coordinates for plot assignments, use identifier for plot (e.g., PLOT_ID).
areawt	String. Name of variable for summarizing area weights (e.g., CONDPROP_UNADJ).
adjplot	Logical. If TRUE, adjusts for nonresponse at plot-level.
unitvar	String. Name of the estimation unit variable in unitarea and cond or pltassgn data frame with estimation unit assignment for each plot (e.g., 'ESTN_UNIT'). Optional if only one estimation unit.
unitarea	Numeric or DF. Total area by estimation unit. If only 1 estimation unit, include number of total acreage for the area of interest or a data frame with area and estimation unit. If more than one estimation unit, provide a data frame of total area by estimation unit, including unitvar and areavar.
areavar	String. Name of area variable in unitarea. Default="ACRES".
unitzonal	DF/DT. Table with zonal auxiliary information by estimation unit. For continuous data, means by estimation unit; for categorical data, proportion of class by estimation unit.
prednames	String vector. Name(s) of predictor variables to include in model.
predfac	String vector. Name(s) of prednames that are factors (i.e., categorical). Names will change in output depending on number of categories.
standardize	Logical. If TRUE, predictors are standardized.
returndata	Logical. If TRUE, returns data objects.
savedata	Logical. If TRUE, saves table(s) to outfolder.
saveobj	Logical. If TRUE, saves returned list object to outfolder.
objnm	String. Name of *.rds object.
unit_opts	List. See help(unit_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.

MAdata	List. Data output from FIESTA::MAdata().
pltdat	R List object. Output data list components from FIESTA::spGetPlots().
auxdat	List. Auxiliary data output from FIESTA::spGetAuxiliary().
gui	Logical. If gui, user is prompted for parameters.
...	For extendibility.

Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltassgn (e.g. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if onl
	TPA_UNADJ	Number of trees per acre each sample tree represents (e.g. DESIGNCD=1: TPA_U
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (e.g. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on eacl
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (e.g. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

For available reference tables: sort(unique(FIESTAutils::ref_codes$VARIABLE))

Value

A list with population data for Green-Book estimates.

condx	Data frame. Condition-level data including plot-level assignment of estimation unit and stratum (if strata=TRUE) and adjusted condition proportion.
pltcondx	Data frame. Condition-level data, merged with plot data.
cuniqueid	String. Unique identifier of plot in condx and pltcondx.
condid	String. Unique identifier of condition in condx and pltcondx.
treex	Data frame. If esttype='TREE', tree-level data, including sample adjustment factor.

tuniqueid	String. If esttype='TREE', unique identifier of plot in treex.
ACI.filter	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1" .
unitarea	String. Returned table of area by estimation unit.
unitvar	String. Variable name for estimation unit.
expcondtab	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1".
plotsampcnt	Data frame. Number of plots by PLOT_STATUS_CD.
condsampcnt	Data frame. Number of conditions by COND_STATUS_CD.
states	String. State names in dataset.
invyrs	String. Range of inventory years in dataset.

Variable	**Description**
unitvar	estimation unit
n.total	number of plots for estimation unit
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonsampled plots removed
AREA_USED	total area of estimation unit
expfac	strata-level expansion factor after nonsampled plots and conditions removed (AREA_USEI
EXPNS	strata-level area expansions (expfac * strwt)

Table(s) are also written to outfolder.

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. *PROP_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA_UNADJ as follows:

PLOT SIZE	**TPA_UNADJ**
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

unitcombine:
If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10

plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

stratcombine:
If TRUE and less than 2 plots in any one strata class within an estimation unit, all strata classes with 2 or less plots are combined. The current method for combining is to group the strata with less than 2 plots with the strata class following in consecutive order (numeric or alphabetical), restrained by estimation unit (if unitcombine=FALSE), and continuing until the number of plots equals 10. If there are no strata classes following in order, it is combined with the estimation unit previous in order.

modMAratio *Model-Assisted module - Generate model-assisted tree estimates.*

Description

Generates tree estimates by estimation unit. Estimates are calculated from McConville et al. (2018)'s mase R package.

Usage

```
modMAratio(
  MApopdat,
  ratiotype = "PERACRE",
  woodland = "Y",
  landarea = "FOREST",
  estseed = "none",
  pcfilter = NULL,
  estvarn = NULL,
  estvarn.filter = NULL,
  estvard = NULL,
  estvard.filter = NULL,
  prednames = NULL,
  FIA = TRUE,
  rowvar = NULL,
  colvar = NULL,
  sumunits = TRUE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  bootstrap = FALSE,
  modelselect = FALSE,
  ...
)
```

Arguments

MApopdat	List. Population data objects returned from modMApop().
ratiotype	String. The type of ratio estimates ("PERACRE", "PERTREE").
woodland	String. If woodland = 'Y', include woodland tree species where measured. If woodland = 'N', only include timber species. See FIESTA::ref_species$WOODLAND ='Y/N'. If woodland = 'only', only include woodland species.

landarea	String. The sample area filter for estimates ("FOREST", "TIMBERLAND"). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
estseed	String. Use seedling data only or add to tree data. Seedling estimates are only for counts (estvar='TPA_UNADJ')-('none', 'only', 'add').
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
estvarn	String. Name of the tree estimate variable (numerator).
estvarn.filter	String. A tree filter for the estimate variable (numerator). Must be R syntax (e.g., "STATUSCD == 1").
estvard	String. Name of the tree estimate variable (denominator).
estvard.filter	String. A tree filter for the estimate variable (denominator). Must be R syntax (e.g., "STATUSCD == 1").
prednames	String vector. Name(s) of predictor variables to include in model.
FIA	Logical. If TRUE, the finite population term is removed from estimator to match FIA estimates.
rowvar	String. Optional. Name of domain variable to group estvarn and estvard by for rows in table output. Rowvar must be included in an input data frame (i.e., plt, cond, tree). If no rowvar is included, an estimate is returned for the total estimation unit. Include colvar for grouping by 2 variables.
colvar	String. Optional. If rowvar != NULL, name of domain variable to group estvarn and estvard by for columns in table output. Colvar must be included in an input data frame (i.e., plt, cond, tree).
sumunits	Logical. If TRUE, estimation units are summed and returned in one table.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
bootstrap	Logical. If TRUE, returns bootstrap variance estimates, otherwise uses Horvitz-Thompson estimator under simple random sampling without replacement.
modelselect	Logical. If TRUE, an elastic net regression model is fit to the entire plot level data, and the variables selected in that model are used for the proceeding estimation.
...	Parameters for modMApop() if MApopdat is NULL.

Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltassgn (e.g. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if onl
	TPA_UNADJ	Number of trees per acre each sample tree represents (e.g., DESIGNCD=1: TPA_U
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on eacl
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

Reference names are available for the following variables:
ADFORCD, AGENTCD, CCLCD, DECAYCD, DSTRBCD, KINDCD, OWNCD, OWNGRPCD, FORTYPCD, FLDTYPCD, FORTYPCDCALC, TYPGRPCD, FORINDCD, RESERVCD, LANDCLCD, STDSZCD, FLDSZCD, PHYSCLCD, MIST_CL_CD, PLOT_STATUS_CD, STATECD, TREECLCD, TRTCD, SPCD, SPGRPCD

Value

If FIA=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned with tree estimates and percent sample errors. Otherwise, a list is returned with tree estimates in one data frame (est) and percent sample errors in another data frame (est.pse). If rawdata=TRUE, another list is returned including raw data used in the estimation process. If addtitle=TRUE and returntitle=TRUE, the title for est/pse is returned. If savedata=TRUE, all data frames are written to outfolder.

`est`	Data frame. Tree estimates by rowvar, colvar (and estimation unit). If FIA=TRUE or one estimation unit and colvar=NULL, estimates and percent sampling error are in one data frame.
`pse`	Data frame. Percent sampling errors for estimates by rowvar and colvar (and estimation unit).
`titlelst`	List with 1 or 2 string vectors. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables.
`raw`	List of data frames. If rawdata=TRUE, a list including: number of plots by plot status, if in dataset (plotsampcnt); number of conditions by condition status (condsampcnt); data used for post-stratification (stratdat); and 1-8 tables with calculated variables used for processing estimates and percent sampling error for table cell values and totals (See processing data below).

Raw data

plotsampcnt	Table. Number of plots by plot status (ex. sampled forest on plot, sampled nonforest, nonsampled).
condsampcnt	DF. Number of conditions by condition status (forest land, nonforest land, non-census water, census water, nonsampled).
unitarea	DF. Area by estimation unit.
expcondtab	DF. Condition-level area expansion factors.
tdomdat	DF. Final data table used for estimation.

The data frames include the following information:

Variable	**Description**
rhat	estimated ratio estn/estd
rhat.var	variance estimate of estimated ratio estn/estd
NBRPLT Number of plots used in estimates	
NBRPLT.gt0	Number of non-zero plots used in estimates
ACRES	total area for estimation unit
rhat.se	estimated standard error of ratio sqrt(rhat.var)
rhat.cv	estimated coefficient of variation of ratio rhat.se/rhat
rhat.pse	estimated percent standard error or ratio rhat.cv*100
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

Table(s) are also written to outfolder.

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. *PROP_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA_UNADJ as follows:

PLOT SIZE	**TPA_UNADJ**
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.

If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

sumunits:
An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

autoxreduce:
If MAmethod='GREG', and autoxreduce=TRUE, and there is an error because of multicolinearity, a variable reduction method is applied to remove correlated variables. The method used is based on the variance-inflation factor (vif) from a linear model. The vif estimates how much the variance of each x variable is inflated due to mulitcolinearity in the model.

rowlut/collut:
There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:
1-the merging variable with same name as the variable in the input merge table;
2-the ordering or descriptive variable.
If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

UNITS:
The following variables are converted from pounds (from FIA database) to short tons by multiplying the variable by 0.0005. DRYBIO_AG, DRYBIO_BG, DRYBIO_WDLD_SPP, DRYBIO_SAPLING, DRYBIO_STUMP, DRYBIO_TOP, DRYBIO_BOLE, DRYBIOT, DRYBIOM, DRYBIOTB, JBIOTOT, CARBON_BG, CARBON_AG

MORTALITY:
For Interior-West FIA, mortality estimates are mainly based on whether a tree has died within the last 5 years of when the plot was measured. If a plot was remeasured, mortality includes trees that were alive the previous visit but were dead in the next visit. If a tree was standing the previous visit, but was not standing in the next visit, no diameter was collected (DIA = NA) but the tree is defined as mortality.

Common tree filters:

FILTER	**DESCRIPTION**
"STATUSCD == 1"	Live trees
"STATUSCD == 2"	Dead trees
"TPAMORT_UNADJ > 0"	Mortality trees
"STATUSCD == 2 & DIA >= 5.0"	Dead trees >= 5.0 inches diameter

"STATUSCD == 2 & AGENTCD == 30"	Dead trees from fire

modMAtree *Model-Assisted module - Generate model-assisted tree estimates.*

Description

Generates tree estimates by estimation unit. Estimates are calculated from McConville et al. (2018)'s mase R package.

Usage

```
modMAtree(
  MApopdat,
  MAmethod,
  estvar,
  estvar.filter = NULL,
  estseed = "none",
  woodland = "Y",
  landarea = "FOREST",
  pcfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  prednames = NULL,
  modelselect = FALSE,
  FIA = TRUE,
  bootstrap = FALSE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  modelselect_bydomain = FALSE,
  ...
)
```

Arguments

MApopdat	List. Population data objects returned from modMApop().
MAmethod	String. mase (i.e., model-assisted) method to use ('greg', 'gregEN', 'ratio').
estvar	String. Name of the tree-level estimate variable (e.g., 'VOLCFNET').
estvar.filter	String. A tree-level filter for estvar. Must be R syntax (e.g., 'STATUSCD == 1').
estseed	String. Use seedling data only or add to tree data. Seedling estimates are only for counts (estvar='TPA_UNADJ')-('none', 'only', 'add').
woodland	String. If woodland = 'Y', include woodland tree species where measured. If woodland = 'N', only include timber species. See FIESTA::ref_species$WOODLAND ='Y/N'. If woodland = 'only', only include woodland species.
landarea	String. The condition-level filter for defining land area ('ALL', 'FOREST', 'TIMBERLAND'). If landarea='FOREST', COND_STATUS_CD = 1; if landarea='TIMBERLAND', SITECLCD in(1:6) & RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
rowvar	String. Optional. Name of domain variable to group estvar by for rows in table output. Rowvar must be included in an input data frame (i.e., plt, cond, tree). If no rowvar is included, an estimate is returned for the total estimation unit. Include colvar for grouping by 2 variables.
colvar	String. Optional. If rowvar != NULL, name of domain variable to group estvar by for columns in table output. Colvar must be included in an input data frame (i.e., plt, cond, tree).
prednames	String vector. Name(s) of predictor variables to include in model.
modelselect	Logical. If TRUE, an elastic net regression model is fit to the entire plot level data, and the variables selected in that model are used for the proceeding estimation.
FIA	Logical. If TRUE, the finite population term is removed from estimator to match FIA estimates.
bootstrap	Logical. If TRUE, returns bootstrap variance estimates, otherwise uses Horvitz-Thompson estimator under simple random sampling without replacement.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
modelselect_bydomain	Logical. If TRUE, modelselection will occur at the domain level as specified by rowvar and/or colvar and not at the level of the entire sample.
...	Parameters for modMApop() if MApopdat is NULL.

Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltassgn (e.g. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if onl
	TPA_UNADJ	Number of trees per acre each sample tree represents (e.g., DESIGNCD=1: TPA_U
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on eacl
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

Reference names are available for the following variables:
ADFORCD, AGENTCD, CCLCD, DECAYCD, DSTRBCD, KINDCD, OWNCD, OWNGRPCD, FORTYPCD, FLDTYPCD, FORTYPCDCALC, TYPGRPCD, FORINDCD, RESERVCD, LANDCLCD, STDSZCD, FLDSZCD, PHYSCLCD, MIST_CL_CD, PLOT_STATUS_CD, STATECD, TREECLCD, TRTCD, SPCD, SPGRPCD

Value

If FIA=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned with tree estimates and percent sample errors. Otherwise, a list is returned with tree estimates in one data frame (est) and percent sample errors in another data frame (est.pse). If rawdata=TRUE, another list is returned including raw data used in the estimation process. If addtitle=TRUE and returntitle=TRUE, the title for est/pse is returned. If savedata=TRUE, all data frames are written to outfolder.

`est`	Data frame. Tree estimates by rowvar, colvar (and estimation unit). If FIA=TRUE or one estimation unit and colvar=NULL, estimates and percent sampling error are in one data frame.
`pse`	Data frame. Percent sampling errors for estimates by rowvar and colvar (and estimation unit).
`titlelst`	List with 1 or 2 string vectors. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables.

raw List of data frames. If rawdata=TRUE, a list including: number of plots by plot status, if in dataset (plotsampcnt); number of conditions by condition status (condsampcnt); data used for post-stratification (stratdat); and 1-8 tables with calculated variables used for processing estimates and percent sampling error for table cell values and totals (See processing data below).

Raw data

plotsampcnt Table. Number of plots by plot status (ex. sampled forest on plot, sampled nonforest, nonsampled).

condsampcnt DF. Number of conditions by condition status (forest land, nonforest land, noncensus water, census water, nonsampled).

stratdat Data frame. Strata information by estimation unit.

Variable	Description
ESTUNIT	estimation unit
STRATA	strata
ACRES	area by strata for estimation unit
n.strata	number of plots in strata (and estimation unit)
n.total	number of plots for estimation unit
TOTACRES	total area for estimation unit
strwt	proportion of area (or number of plots) by strata (strata weight)
expfac.strata	expansion factor (in area unit (e.g., acres) by strata (areavar/n.strata)

processing data

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), and if colvar is not NULL, colvar totals, (unit.colvar); and a combination of rowvar and colvar (unit.grpvar). If FIA=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grpest, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

Variable	Description
nhat	estimated proportion of trees
nhat.var	estimated variance of estimated proportion of trees
ACRES	total area for estimation unit
est	estimated area of trees nhat*ACRES
est.var	estimated variance of estimated area of trees nhat.var*areavar^2
est.se	standard error of estimated area of trees sqrt(est.var)
est.cv	coefficient of variation of estimated area of trees est.se/est
pse	percent sampling error of estimate est.cv*100
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area

CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

Table(s) are also written to outfolder.

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. *PROP_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

sumunits:
An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

stratcombine:
If MAmethod='PS', and stratcombine=TRUE, and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

autoxreduce:
If MAmethod='GREG', and autoxreduce=TRUE, and there is an error because of multicolinearity, a variable reduction method is applied to remove correlated variables. The method used is based on the variance-inflation factor (vif) from a linear model. The vif estimates how much the variance of each x variable is inflated due to mulitcolinearity in the model.

rowlut/collut:
There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive

names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:
1-the merging variable with same name as the variable in the input merge table;
2-the ordering or descriptive variable.
If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

UNITS:
The following variables are converted from pounds (from FIA database) to short tons by multiplying the variable by 0.0005. DRYBIO_AG, DRYBIO_BG, DRYBIO_WDLD_SPP, DRYBIO_SAPLING, DRYBIO_STUMP, DRYBIO_TOP, DRYBIO_BOLE, DRYBIOT, DRYBIOM, DRYBIOTB, JBIOTOT, CARBON_BG, CARBON_AG

MORTALITY:
For Interior-West FIA, mortality estimates are mainly based on whether a tree has died within the last 5 years of when the plot was measured. If a plot was remeasured, mortality includes trees that were alive the previous visit but were dead in the next visit. If a tree was standing the previous visit, but was not standing in the next visit, no diameter was collected (DIA = NA) but the tree is defined as mortality.

Common tree filters:

FILTER	DESCRIPTION
"STATUSCD == 1"	Live trees
"STATUSCD == 2"	Dead trees
"TPAMORT_UNADJ > 0"	Mortality trees
"STATUSCD == 2 & DIA >= 5.0"	Dead trees >= 5.0 inches diameter
"STATUSCD == 2 & AGENTCD == 30"	Dead trees from fire

modPB *Photo-Based module - Generate photo-based estimates.*

Description

Generates percent, area or ratio-of-means estimates, with associated sampling error by domain (and estimation unit). Calculations are based on Patterson (2012) photo-based estimators for the Nevada photo-based inventory.

Usage

```
modPB(
  PBpopdat = NULL,
  tabtype = "PCT",
  sumunits = FALSE,
  ratio = FALSE,
  landarea = "ALL",
  landarea.filter = NULL,
  nonsamp.pntfilter = NULL,
  pntfilter = NULL,
  pfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
```

```
  domlut = NULL,
  domvarlst = NULL,
  ratioden = "ROWVAR",
  gainloss = FALSE,
  gainloss.vals = NULL,
  addtitle = FALSE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)
```

Arguments

PBpopdat	List. Population data objects returned from modPBpop().
tabtype	String. Type of units for the table ("PCT", "AREA").
sumunits	Logical. If TRUE, estimation units are combined to one table for output. Note: only available if tabtype="AREA". Acres
ratio	Logical. If TRUE, ratio estimates are generated.
landarea	String. Sample area for estimates ("ALL", "CHANGE"). Used to describe landarea.filter.
landarea.filter	String. filter for land area. Must be R syntax.
nonsamp.pntfilter	String. An expression for filtering nonsampled points (e.g., cloud coverage). Must be R syntax.
pntfilter	String. A global filter for the pnt file. Must be R syntax.
pfilter	String. A global filter for the plt file. Must be R syntax.
rowvar	String. Name of domain variable in pnt used for output estimation table rows. If only 1 domain, must be rowvar. If no domain, rowvar=NULL.
colvar	String. Name of domain variable in pnt used for output estimation table columns. If only 1 domain, colvar=NULL.
domlut	DF/DT or comma-delimited (*.csv). Look-up table to define the variables in the pnt table with category codes (DOMCODE) and code names (DOMNAME), and to set a pretty name for the variable to use in output table (DOMTITLE). This table is also used to populate rowvar/colvar, row.orderby/col.orderby, and title.rowvar/title.colvar parameters. Optional.
domvarlst	String vector. A vector of variable names that can be row or column domains (codes and names). Optional.
ratioden	String. ("ROWVAR" or "COLVAR"). If ratio, defines whether the rowvar or colvar in estimation output table is the denominator.

gainloss	Logical. If TRUE, a table with the difference of gain and loss along with the variance and standard error, in percent, is generated.
gainloss.vals	String vector. A vector of names for values in gainloss table.
addtitle	Logical. If TRUE and savedata=TRUE, adds title to outfile.
returntitle	Logical. If TRUE, returns a character string of the title of the output data frame.
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modPBpop() if PBpopdat is NULL.

Details

If variables are NULL, then it will prompt user to input variables.

Value

A list with estimates with percent sampling error for rowvar (and colvar). If sumunits=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned. Otherwise, a list object is returned with the following information. If savedata=TRUE, all data frames are written to outfolder.

est	DF. Estimated percent cover or area by rowvar, colvar, (and estimation unit).
pse	DF. Percent sampling error of estimates by rowvar, colvar (and estimation unit).
titlelst	List with 1 or 2 string vectors. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables. Row and column tables are also included in list.
raw	List of data frames. If rawdata=TRUE, a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).

Raw data

pntsampcnt	Table. Number of points by rowvar/colvar (sampled and nonsampled).
stratdat	Data frame. Strata information by estimation unit.

Variable	Description
unitvar	estimation unit
strvar	strata
areavar	If tabtype='AREA', area by strata for estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
TOTAREA	If tabtype='AREA', total area for estimation unit
strwt	proportion of area (or number of plots) by strata (strata weight)

`processing data`

Data frames. Separate data frames of variables used in estimation process for the rowvar, colvar and combination of rowvar and colvar (if colvar is not NULL), and grand total by estimation unit (unit.rowest, unit.colest, unit.grpest, respectively) and summed estimation units, if FIA=TRUE (rowest, colest, grpest, respectively).

The data frames include the following information:

Variable	Description
phat	estimated proportion of covered land
phat.var	variance of estimated proportion of covered lan
areavar	If tabtype='AREA', total area for estimation un
est	If tabtype='AREA', estimated area of land phat
est.var	variance of estimated area of land phat.var*area

If tabtype='PCT', estimated percent cover of land phat.var*100

est.se	standard error of estimated area or percent cove
est.cv	coefficient of variance of estimated area or perc
est.pse	percent sampling error of estimated area of per
CI99left	left tail of 99 percent confidence interval for es
CI99right	right tail of 99 percent confidence interval for e
CI95left	left tail of 95 percent confidence interval for es
CI95right	right tail of 95 percent confidence interval for e
CI67left	left tail of 67 percent confidence interval for es
CI67right	right tail of 67 percent confidence interval for e

if ratio=TRUE:

Variable	Description
phat.n	estimated proportion of covered land, for numer
phat.var.n	variance of estimated proportion of covered lan
phat.d	estimated proportion of covered land, for denon
phat.var.d	variance of estimated proportion of covered lan
covar	covariance of estimated proportion of numerato
rhat	ratio of estimated proportions (numerator-colva
rhat.var	variance of ratio of estimated proportions
rhat.se	standard error of ratio of estimated proportions
rhat.cv	coefficient of variation of ratio of estimated pro
areavar	If tabtype='AREA', total area for estimation un
est	If tabtype='AREA', estimated area of land rhat
est.var	variance of estimated area of land rhat.var*area

If tabtype='PCT', estimated percent cover of land rhat.var*100

est.se	standard error of estimated area or percent cove
est.cv	coefficient of variance of estimated area or perc
est.pse	percent sampling error of estimated area of perc
CI99left	left tail of 99 percent confidence interval for est
CI99right	right tail of 99 percent confidence interval for e
CI95left	left tail of 95 percent confidence interval for est
CI95right	right tail of 95 percent confidence interval for e

CI67left	left tail of 67 percent confidence interval for est
CI67right	right tail of 67 percent confidence interval for e

Note

STRATA:
Stratification is used to reduce variance in population estimates by partitioning the population into homogenous classes (strata), such as forest and nonforest. For stratified sampling methods, the strata sizes (weights) must be either known or estimated. Remotely-sensed data is often used to generate strata weights with proporation of pixels by strata. If stratification is desired (strata=TRUE), the required data include: stratum assignment for the center location of each plot, stored in either pltassgn or cond; and a look-up table with the area or proportion of the total area of each strata value by estimation unit, making sure the name of the strata (and estimation unit) variable and values match the plot assignment name(s) and value(s).

sumunits:
An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If sumunits=TRUE, estimates are generated by estimation unit, summed together, and returned as one estimate. If rawdata=TRUE, estimates by individual estimation unit are also returned.

If sumunits=FALSE, estimates are generated and returned by estimation unit as one data frame. If savedata=TRUE, a separate file is written for each estimation unit.

stratcombine:
If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

rowlut/collut:
There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:
1-the merging variable with same name as the variable in the input merge table;
2-the ordering or descriptive variable.
If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

  title_opts = list(title.rowvar = "Land Cover (2011)")
)

cover1.unit.area.sum$est
```

---

modPBpop *Photo-Based module - Generate population data for PB module.*

Description

Generates population data for generating photo-based estimation. Plots that are totally nonsampled are excluded from estimation dataset. Next, an adjustment factor is calculated by strata to adjust for nonsampled (nonresponse) conditions that have proportion less than 1. Attributes adjusted to a per-acre value are summed by plot, divided by the adjustment factor, and averaged by stratum. Strata means are combined using the strata weights and then expanded to using the total land area in the population.

Usage

```
modPBpop(
  pntdat = NULL,
  pltpct = NULL,
  plotid = "plot_id",
  pntid = NULL,
  pltpctvars = NULL,
  plt = NULL,
  pltassgn = NULL,
  puniqueid = "CN",
```

```
  pltassgnid = "CN",
  nonsamp.pfilter = NULL,
  sumunits = FALSE,
  unitvar = NULL,
  unitarea = NULL,
  areavar = "ACRES",
  strata = FALSE,
  strtype = "POST",
  stratalut = NULL,
  strvar = "STRATUMCD",
  pvars2keep = NULL,
  saveobj = FALSE,
  objnm = "PBpopdat",
  savedata = FALSE,
  unit_opts = NULL,
  strata_opts = NULL,
  savedata_opts = NULL,
  PBstratdat = NULL,
  gui = FALSE
)
```

Arguments

pntdat	DF/DT or comma-delimited file (*.csv). Point-level table with one record per point. If NULL, aggregated point counts must be in pntcnt.
pltpct	DF/DT or comma-delimited file (*.csv). Plot-domain-level table with percent observed by domain per plot.
plotid	String. Unique identifier of plot in pnt. All values must match puniqueid values, if pltassgn is not NULL.
pntid	String. Unique identifier of points in pnt.
pltpctvars	String vector. Variables in pltpct for estimation. If NULL, all variables are used except plotid in pltpct.
plt	DF/DT, comma-separated values (CSV) file(*.csv), or layer in dsn, Can also be a shapefile(*.shp) with one record per plot, a spatial layer in dsn, or a sf R object. Plot-level variables. If nonsampled plots are included, PLOT_STATUS_CD variable must be in table. Optional.
pltassgn	DF/DT, comma-delimited file(*.csv), SpatialDataFrame, or shapefile(*.shp). The plot-level data with one record per plot, including estimation unit and/or strata information. Optional.
puniqueid	String. Unique identifier of plot.
pltassgnid	String. Name of unique identifier of plot in pltassgn with All values must match plotid values if pnt is not NULL.
nonsamp.pfilter	String. An expression for filtering nonsampled plots. Must be R syntax.
sumunits	Logical. If TRUE, estimation units are combined to one table for output. Note: only available if tabtype="AREA". Acres

unitvar	String. Name of the estimation unit variable in cond or pltassgn with estimation unit assignment for each plot (e.g., 'ESTN_UNIT'). If one estimation unit, set unitvar=NULL.
unitarea	Numeric or DF. Total area by estimation unit. If only 1 estimation unit, include number of total acreage for the area of interest or a data frame with areavar. If more than one estimation unit, provide a data frame of total area by estimation unit, including unitvar and areavar.
areavar	String. Name of acre variable in unitarea. Default="ACRES".
strata	Logical. If TRUE, add data information for stratification.
strtype	String. If strata=TRUE, the type of strata ('POST', 'PRE'). Note: the variance equations are slightly different.
stratalut	DF/DT. If strata=TRUE, look-up table with strata proportions ('strwt') by strata (and estimation unit). To calculate 'strwt', set getwt=TRUE and getwtvar= name of variable with information to calculate weights from (e.g., pixel counts)
strvar	String. If strata=TRUE, name of the strata variable in stratalut and cond or pltassgn data frame with stratum assignment for each plot (Default = 'STRATUMCD').
pvars2keep	String vector. Additional plot variables to keep in dataset.
saveobj	Logical. If TRUE, saves SApopdat object to outfolder.
objnm	String. Name of *.rda object.
savedata	Logical. If TRUE, saves table(s) to outfolder.
unit_opts	List. See help(unit_options()) for a list of options.
strata_opts	List. See help(strata_options()) for a list of options. Only used when strata = TRUE.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
PBstratdat	R List object. Output data list components from FIESTA::DBgetStrata().
gui	Logical. If gui, user is prompted for parameters.

Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if onl
	TPA_UNADJ	Number of trees per acre each sample tree represents (ex. DESIGNCD=1: TPA_U
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest

	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on eacl
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

For available reference tables: sort(unique(FIESTAutils::ref_codes$VARIABLE))

Value

A list with population data for Green-Book estimates.

`condx`	Data frame. Condition-level data including plot-level assignment of estimation unit and stratum (if strata=TRUE) and adjusted condition proportion.
`pltcondx`	Data frame. Condition-level data, merged with plot data.
`cuniqueid`	String. Unique identifier of plot in condx and pltcondx.
`condid`	String. Unique identifier of condition in condx and pltcondx.
`treex`	Data frame. If esttype='TREE', tree-level data, including sample adjustment factor.
`tuniqueid`	String. If esttype='TREE', unique identifier of plot in treex.
`ACI.filter`	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1" .
`unitarea`	String. Returned table of area by estimation unit.
`unitvar`	String. Variable name for estimation unit.
`strlut`	String. Strata-level table with pixel counts by strata (P1POINTCNT), strata weights (strwt), number of plots by strata (n.strata), total number of plots in estimation unit (n.total), sum of condition proportions (*_UNADJ_SUM), area adjustments (*_ADJFAC), total area, and area expansion by strata (EXPNS).
`strvar`	String. Variable name for strata. If strata=FALSE, strvar="ONESTRAT".
`expcondtab`	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1" .
`plotsampcnt`	Data frame. Number of plots by PLOT_STATUS_CD.
`condsampcnt`	Data frame. Number of conditions by COND_STATUS_CD.
`states`	String. State names in dataset.
`invyrs`	String. Range of inventory years in dataset.
`stratdat`	Data frame. Strata information by estimation unit.

Variable	Description
unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (i.e., strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonsampled plots removed
AREA_USED	total area of estimation unit
expfac	strata-level expansion factor after nonsampled plots and conditions removed (AREA_USEI
EXPNS	strata-level area expansions (expfac * strwt)

Table(s) are also written to outfolder.

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. *PROP_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

unitcombine:
If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

stratcombine:
If TRUE and less than 2 plots in any one strata class within an estimation unit, all strata classes with 2 or less plots are combined. The current method for combining is to group the strata with less than 2 plots with the strata class following in consecutive order (numeric or alphabetical), restrained by estimation unit (if unitcombine=FALSE), and continuing until the number of plots equals 10. If

there are no strata classes following in order, it is combined with the estimation unit previous in order.

modSAarea *Small area module - Generate small area tree estimates.*

Description

Generates small area estimates by domain and/or tree domain (and estimation unit).

Usage

```
modSAarea(
  SApopdatlst = NULL,
  prednames = NULL,
  SApackage = "JoSAE",
  SAmethod = "area",
  largebnd.unique = NULL,
  landarea = "FOREST",
  pcfilter = NULL,
  rowvar = NULL,
  modelselect = FALSE,
  prior = function(x) 1/(sqrt(x) * (1 + x)),
  na.fill = "NONE",
  savedata = FALSE,
  savesteps = FALSE,
  multest = TRUE,
  addSAdomsdf = TRUE,
  SAdomvars = NULL,
  savemultest = FALSE,
  returntitle = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  multest_opts = NULL,
  save4testing = FALSE,
  gui = FALSE,
  ...
)
```

Arguments

SApopdatlst	List. List of population data objects returned from modSApop().
prednames	String vector. Name(s) of predictor variables to use in model.
SApackage	String. Small area package to use ('JoSAE', 'sae', 'hbsae')
SAmethod	String. Small area method to use ('unit', 'area')
largebnd.unique	String. Name of the large boundary unique identifer to define plots within a model extent. If NULL, all plots are used for model extent.

landarea	String. The sample area filter for estimates ('ALL', 'FOREST', 'TIMBERLAND'). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
rowvar	String. Name of the row domain variable in cond or tree. If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.
modelselect	Logical. If TRUE, selects useful predictors using mase:ElasticNet.
prior	Function. A prior function to use for hbsae models.
na.fill	String. An estimate to fill in for NA values (i.e., when model is unstable or no predictors are selected). Choose from the following list that does not include SApackage used ('NONE', 'DIR', 'JoSAE', 'sae', 'hbsae'). DIR is suggested value for no NA values.
savedata	Logical. If TRUE, saves table(s) to outfolder.
savesteps	Logical. Saves graphs of predictors and response with labels whether selected or not for both area- and unit-level models.
multest	Logical. If TRUE, returns a data frame of SA estimates using both unit-level and area-level estimates.
addSAdomsdf	Logical. If TRUE, appends SAdomdf to unit.multest table for output.
SAdomvars	String vector. List of attributes from SAdoms to include in multest output.
savemultest	Logical. If TRUE, save table with area- and unit-level estimates.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
multest_opts	List. See help(multest_options()) for a list of options. Only used when multest = TRUE.
save4testing	Logical. If TRUE, saves intermediate steps as R objects to outfolder for testing (pdomdat, dunitlut).
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modSApop if SApopdat is NULL.

Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltstrat (e.g., PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if on

	TPA_UNADJ	Number of trees per acre each sample tree represents (ex. DESIGNCD=1: TPA_U
cond	cuniqueid	Unique identifier for each plot, to link to pltstrat (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition p
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, e
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonfores
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNAD
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on eac
pltassign	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assum

Reference names are available for the following variables:
ADFORCD, AGENTCD, CCLCD, DECAYCD, DSTRBCD, KINDCD, OWNCD, OWNGRPCD, FORTYPCD, FLDTYPCD, FORTYPCDCALC, TYPGRPCD, FORINDCD, RESERVCD, LANDCLCD, STDSZCD, FLDSZCD, PHYSCLCD, MIST_CL_CD, PLOT_STATUS_CD, STATECD, TREECLCD, TRTCD, SPCD, SPGRPCD

Value

`est`	Data frame. Tree estimates and percent sampling error by domain. Estimates are based on the SApackage and SAmethod parameters defined.
`titlelst`	List. List of titles used for table output.
`raw`	List of raw data. If rawdata=TRUE, a list including raw data components used for calculating estimate.
`dunit.multest`	Data frame. Table comparing different estimation strategies for SAE.
Raw data	
`domdat`	Data frame. Domain-level data used for estimation.
`dunit.totest`	String. Table of estimates, including more details.

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. For model-based estimation, we calculate adjustment factors by plot.

It is calculated by dividing 1 / summed condition proportions by plot. An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046

MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

```

modSApop *Small area module - Compile population data for SA module.*

Description

Compile population data for input to the modSA* modules.

Usage

```
modSApop(
  popType = "VOL",
  popTabs = popTables(),
  popTabIDs = popTableIDs(),
  popFilter = popFilters(),
  pltassgn = NULL,
  pltassgnid = "PLT_CN",
  dsn = NULL,
  pjoinid = "CN",
  areawt = "CONDPROP_UNADJ",
  adjplot = TRUE,
  dunitvar = NULL,
  dunitarea = NULL,
  areavar = "ACRES",
  dunitzonal = NULL,
  prednames = NULL,
  predfac = NULL,
  returndata = TRUE,
  savedata = FALSE,
  saveobj = FALSE,
  objnm = "SApopdat",
  unit_opts = NULL,
  savedata_opts = NULL,
  SAdoms = NULL,
  smallbnd = NULL,
  smallbnd.domain = NULL,
  SAdata = NULL,
  pltdat = NULL,
  auxdat = NULL,
  gui = FALSE,
  ...
)
```

Arguments

popType	String. Type of evaluation(s) to include in population data. Note: currently only c('CURR', 'VOL', 'LULC') are available. See details below for descriptions of each.

popTabs	List of population tables the user would like returned. See help(popTables) for a list of options.
popTabIDs	List of unique IDs corresponding to the population tables that the user has requested. See help(popTableIDs) for a list of options.
popFilter	List of population filters. See help(popFilters) for a list of options.
pltassgn	DF/DT, comma-separated values (CSV) file(*.csv), or layer in dsn, Can also be a shapefile(*.shp) with one record per plot, a spatial layer in dsn, or a sf R object. Plot-level assignment of estimation unit and/or strata. Optional.
pltassgnid	String. Unique identifier of plot in pltassgn.
dsn	String. Name of database where tree, cond, and pltassgn tables reside. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html).
pjoinid	String. Join variable in plot to match pltassgnid. Does not need to be uniqueid. If using most current XY coordinates for plot assignments, use identifier for plot (e.g., PLOT_ID).
areawt	String. Name of variable for summarizing area weights (e.g., CONDPROP_UNADJ).
adjplot	Logical. If TRUE, adjusts for nonresponse at plot-level.
dunitvar	String. Name of the domain unit variable in cond, plt, or pltassgn with domain unit assignment for each plot.
dunitarea	Numeric or DF. Total area by domain unit.
areavar	String. Name of area variable in unitarea. Default="ACRES".
dunitzonal	DF/DT. Data frame with zonal auxiliary information by domain unit. For continuous data, means by domain unit; for categorical data, proportion of class by domain unit.
prednames	String vector. Name(s) of predictor variables to use in model.
predfac	String vector. Name(s) of factor predictor variables to use in model. Names will change in output depending on number of categories.
returndata	Logical. If TRUE, returns data objects.
savedata	Logical. If TRUE, saves table(s) to outfolder.
saveobj	Logical. If TRUE, saves returned list object to outfolder.
objnm	String. Name of *.rds object.
unit_opts	List. See help(unit_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options.
SAdoms	sf object. SA domains with attributes for joining.
smallbnd	sf object. small bound.
smallbnd.domain	String. Name of attribute defining domain attribute.
SAdata	R List object. Output data list components from FIESTA::SAdata().
pltdat	R List object. Output data list components from FIESTA::spGetPlots().
auxdat	R List object. Output data list components from FIESTA::spGetAuxiliary().
gui	Logical. If gui, user is prompted for parameters.
...	For extendibility.

Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltassgn (e.g. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if onl
	TPA_UNADJ	Number of trees per acre each sample tree represents (e.g. DESIGNCD=1: TPA_U
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (e.g. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on eacl
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (e.g. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

For available reference tables: sort(unique(FIESTAutils::ref_codes$VARIABLE))

Value

A list with population data for Small-Area estimates.

`SAdomsdf`	Data frame. Attribute table from SAdoms spatial layer. Includes DOMAIN and AOI attributes. DOMAIN represents modeling domains. AOI identifies the small area of interest.
`condx`	Data frame. Condition-level data with condition proportions, domain and predictor assignments, and adjusted condition proportions, if adjplot = TRUE.
`pltcondx`	Data frame. Plot/Condition data used for estimation.
`cuniqueid`	String. Unique identifier of plot in condx and pltcondx.
`condid`	String. Unique identifier of condition in condx and pltcondx.
`treex`	Data frame. If esttype='TREE', tree-level data, including adjustment factors, if adjplot = TRUE.
`tuniqueid`	String. If esttype='TREE', unique identifier of plot in treex.
`ACI.filter`	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1" .
`dunitarea`	Data frame. Area by model domain unit.

areavar	String. Name of area variable in dunitarea.
dunitvar	String. Name of variable defining model domain units in dunitarea.
dunitlut	Data frame. Table of model domain units with zonal statistics of predictor values, number of plots by domain unit.
prednames	String vector. Name of variables in dunitlut and condx defining potential predictors for small area estimation.
plotsampcnt	Data frame. Number of plots by PLOT_STATUS_CD.
condsampcnt	Data frame. Number of conditions by COND_STATUS_CD.
states	String. State names in dataset.
invyrs	String. Range of inventory years in dataset.
adjtree	Logical. If TRUE, treex includes adjustment factors.

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. For model-based estimation, we calculate adjustment factors by plot.

It is calculated by dividing 1 / summed condition proportions by plot. An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

modSAtree *Small area module - Generate small area tree estimates.*

Description

Generates small area estimates by domain and/or tree domain (and estimation unit).

Usage

```
modSAtree(
  SApopdatlst = NULL,
  prednames = NULL,
  SApackage = "JoSAE",
  SAmethod = "area",
  estseed = "none",
  woodland = "Y",
  largebnd.unique = NULL,
  landarea = "FOREST",
  pcfilter = NULL,
  estvar = NULL,
  estvar.filter = NULL,
  rowvar = NULL,
  modelselect = FALSE,
  prior = function(x) 1/(sqrt(x) * (1 + x)),
  na.fill = "NONE",

  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  multest_opts = NULL,
  save4testing = FALSE,
  gui = FALSE,
  ...
)
```

Arguments

SApopdatlst	List. List of population data objects returned from modSApop().
prednames	String vector. Name(s) of predictor variables to use in model.
SApackage	String. Small area package to use ('JoSAE', 'sae', 'hbsae')
SAmethod	String. Small area method to use ('unit', 'area')
estseed	String. Use seedling data only or add to tree data. Seedling estimates are only for counts (estvar='TPA_UNADJ')-('none', 'only', 'add').
woodland	String. If woodland = 'Y', include woodland tree species where measured. If woodland = 'N', only include timber species. See FIESTA::ref_species$WOODLAND ='Y/N'. If woodland = 'only', only include woodland species.
largebnd.unique	String. Name of the large boundary unique identifer to define plots within a model extent. If NULL, all plots are used for model extent.
landarea	String. The sample area filter for estimates ('ALL', 'FOREST', 'TIMBERLAND'). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
estvar	String. Name of the tree estimate variable.
estvar.filter	String. A tree filter for estimate variable. Must be R syntax (e.g., "STATUSCD == 1").
rowvar	String. Name of the row domain variable in cond or tree. If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.
modelselect	Logical. If TRUE, selects useful predictors using mase:ElasticNet.
prior	Function. A prior function to use for hbsae models.
na.fill	String. An estimate to fill in for NA values (i.e., when model is unstable or no predictors are selected). Choose from the following list that does not include SApackage used ('NONE', 'DIR', 'JoSAE', 'sae', 'hbsae'). DIR is suggested value for no NA values.

savedata	Logical. If TRUE, saves table(s) to outfolder.
savesteps	Logical. Saves graphs of predictors and response with labels whether selected or not for both area- and unit-level models.
multest	Logical. If TRUE, returns a data frame of SA estimates using both unit-level and area-level estimates.
addSAdomsdf	Logical. If TRUE, appends SAdomdf to unit.multest table for output.
SAdomvars	String vector. List of attributes from SAdoms to include in multest output.
savemultest	Logical. If TRUE, save table with area- and unit-level estimates.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
multest_opts	List. See help(multest_options()) for a list of options. Only used when multest = TRUE.
save4testing	Logical. If TRUE, saves intermediate steps as R objects to outfolder for testing (pdomdat, dunitlut).
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modSApop() if SApopdat is NULL.

	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assum

Reference names are available for the following variables:
ADFORCD, AGENTCD, CCLCD, DECAYCD, DSTRBCD, KINDCD, OWNCD, OWNGRPCD, FORTYPCD, FLDTYPCD, FORTYPCDCALC, TYPGRPCD, FORINDCD, RESERVCD, LANDCLCD, STDSZCD, FLDSZCD, PHYSCLCD, MIST_CL_CD, PLOT_STATUS_CD, STATECD, TREECLCD, TRTCD, SPCD, SPGRPCD

Value

`est`	Data frame. Tree estimates and percent sampling error by domain. Estimates are based on the SApackage and SAmethod parameters defined.
`titlelst`	List. List of titles used for table output.
`raw`	List of raw data. If rawdata=TRUE, a list including raw data components used for calculating estimate.
`dunit.multest`	Data frame. Table comparing different estimation strategies for SAE.
Raw data	
`domdat`	Data frame. Domain-level data used for estimation.
`estvar`	String. Name of estimation variable.
`estvar.filter`	String. Logical filter specified for tree data.
`dunit.totest`	String. Table of estimates, including more details.

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. For model-based estimation, we calculate adjustment factors by plot.

It is calculated by dividing 1 / summed condition proportions by plot. An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

Common tree filters for estvar.filter:

FILTER	DESCRIPTION
"STATUSCD == 1"	Live trees
"STATUSCD == 2"	Dead trees

"TPAMORT_UNADJ > 0"	Mortality trees
"STATUSCD == 2 & DIA >= 5.0"	Dead trees >= 5.0 inches diameter
"STATUSCD == 2 & AGENTCD == 30"	Dead trees from fire

Examples

```
# Set up population dataset (see ?modSApop() for more information)
SApopdat <- modSApop(popTabs = list(tree = FIESTA::WYtree,
                                    cond = FIESTA::WYcond),
                     pltassgn = FIESTA::WYpltassgn,
                     pltassgnid = "CN",
                     dunitarea = FIESTA::WYunitarea,
                     dunitvar = "ESTN_UNIT",
                     dunitzonal = FIESTA::WYunitzonal,
                     prednames = c("dem", "tcc", "tpi", "tnt"),
                     predfac = "tnt")

# Use an area level Fay-Herriot model to estimate total net cubic-foot volume
# of live trees (at least 5 inches diameter)
modSAtree(SApopdatlst = SApopdat,
          SApackage = "JoSAE",
          SAmethod = "unit",
          landarea = "FOREST",
          estvar = "VOLCFNET",
          estvar.filter = "STATUSCD == 1")

# Use a unit level EBLUP to estimate basal area of live trees (at least 5
# inches diameter)
modSAtree(SApopdatlst = SApopdat,
          SApackage = "JoSAE",
          SAmethod = "unit",
          landarea = "FOREST",
          estvar = "BA",
          estvar.filter = "STATUSCD == 1")
```

modWFarea *West-Fest module - Generate population data for WF module.*

Description

Generates population data for generating 'Westfall' Ratio2Size estimates.

Usage

```
modWFarea(
  WFpopdat,
  landarea = "FOREST",
  pcfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  sumunits = TRUE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)
```

Arguments

WFpopdat	List. Population data objects returned from modWFpop().
landarea	String. The sample area filter for estimates ("ALL", "FOREST", "TIMBERLAND"). If landarea=FOREST, filtered to COND_STATUS_CD = 1; If landarea=TIMBERLAND, filtered to SITECLCD in(1:6) and RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
rowvar	String. Name of row domain variable in cond. If only one domain, rowvar = domain variable. If more than one domain, include colvar. If no domain, rowvar = NULL.
colvar	String. Name of column domain variable in cond.
sumunits	Logical. If TRUE, estimation units are summed and returned in one table.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modWFpop() if WFpopdat is NULL.

Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

For available reference tables: sort(unique(FIESTAutils::ref_codes$VARIABLE))

Value

A list with estimates with percent sampling error for rowvar (and colvar). If sumunits=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned. Otherwise, a list object is returned with the following information. If savedata=TRUE, all data frames are written to outfolder.

`est` Data frame. Area estimates, in area units (e.g., acres), by rowvar, colvar (and estimation unit). If sumunits=TRUE or one estimation unit and colvar=NULL, or allin1=TRUE, estimates and percent sampling error are in one data frame.

`pse` Data frame. Percent sampling errors (Confidence level 68 for estimates by rowvar and colvar (and estimation unit).

`titlelst` List. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables. Row and column tables are also included in list.

`raw` List. If rawdata=TRUE, a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).

Raw data

`plotsampcnt` Table. Number of plots by plot status (e.g., sampled forest on plot, sampled nonforest, nonsampled).

`condsampcnt` DF. Number of conditions by condition status (forest land, nonforest land, noncensus water, census water, nonsampled).

`unitarea` DF. Area by estimation unit.

`expcondtab` DF. Condition-level area expansion factors.

`domdat` DF. Final data table used for estimation.

`stratdat` Data frame. Strata information by estimation unit.

Variable	Description
unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonresponse plots removed
AREA	total area for estimation unit
CONDPROP_ADJFAC	average area

`processing data`

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), colvar totals, if not NULL (unit.colvar); and a combination of rowvar and colvar, if colvar is not NULL (unit.grpvar). If sumunits=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grpest, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

Variable	Description
nhat	estimate proportion of land
nhat.var	variance estimate of estimated proportion of land
NBRPLT.gt0	Number of non-zero plots used in estimates
AREA	total area for estimation unit
est	estimated area of land nhat*areavar
est.var	variance estimate of estimate acres of land nhat.var*areavar^2
est.se	standard error of estimated area of land sqrt(est.var)
est.cv	coefficient of variation of estimated area of land est.se/est
pse	percent sampling error of estimate est.cv*100
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

savedata
if savedata=TRUE...
tables with estimate and percent standard error will be written as *csv files to outfolder. if rawdata=TRUE, the rawdata will be output to the outfolder in a folder named rawdata (if raw_fmt="csv") or a database in the outfolder, if (raw_fmt != "csv").

if outfn.pre is not null...
a prefix is added to output files if raw_fmt = 'csv', prefix is added to file names in rawdata folder if raw_fmt != 'csv', prefix is added to dsn name

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata by summing the unadjusted condition proportions (CONDPROP_UNADJ) and dividing by the number of plots in the strata/estimation unit.

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

STRATA:
Stratification is used to reduce variance in population estimates by partitioning the population into homogenous classes (strata), such as forest and nonforest. For stratified sampling methods, the strata sizes (weights) must be either known or estimated. Remotely-sensed data is often used to generate strata weights with proporation of pixels by strata. If stratification is desired (strata=TRUE), the required data include: stratum assignment for the center location of each plot, stored in either pltassgn or cond; and a look-up table with the area or proportion of the total area of each strata value by estimation unit, making sure the name of the strata (and estimation unit) variable and values match the plot assignment name(s) and value(s).

sumunits:
An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If sumunits=TRUE, estimates are generated by estimation unit, summed together, and returned as one estimate. If rawdata=TRUE, estimates by individual estimation unit are also returned.

If sumunits=FALSE, estimates are generated and returned by estimation unit as one data frame. If savedata=TRUE, a separate file is written for each estimation unit.

stratcombine:
If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

rowlut/collut:
There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:
1-the merging variable with same name as the variable in the input merge table;
2-the ordering or descriptive variable.
If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

modWFpop *West-Fest module - Generate population data for WF module.*

Description

Generates population data for generating 'Westfall' Ratio2Size estimates.

Usage

```
modWFpop(
  popType = "VOL",
  popTabs = popTables(),
  popTabIDs = popTableIDs(),
  popFilter = popFilters(),
  pltassgn = NULL,
  pltassgnid = "PLT_CN",
  dsn = NULL,
  pjoinid = "CN",
  areawt = "CONDPROP_UNADJ",
  adj = "samp",
  unitvar = NULL,
  unitarea = NULL,
  areavar = "ACRES",
```

```
  strata = TRUE,
  stratalut = NULL,
  strvar = "STRATUMCD",
  savedata = FALSE,
  saveobj = FALSE,
  objnm = "GBpopdat",
  unit_opts = NULL,
  strata_opts = NULL,
  savedata_opts = NULL,
  GBdata = NULL,
  pltdat = NULL,
  stratdat = NULL,
  auxdat = NULL,
  gui = FALSE,
  ...
)
```

Arguments

popType	String. Type of evaluation(s) to include in population data. Note: currently only c('CURR', 'VOL', 'LULC', 'DWM') are available. See details below for descriptions of each.
popTabs	List of population tables the user would like returned. See help(popTables) for a list of options.
popTabIDs	List of unique IDs corresponding to the population tables that the user has requested. See help(popTableIDs) for a list of options.
popFilter	List of population filters. See help(popFilters) for a list of options.
pltassgn	DF/DT, Optional. R object, sf R object, comma-delimited file(.csv), layer or spatial layer in dsn, or shapefile(.shp). Plot-level assignment of estimation unit and/or strata, with one record for each plot.
pltassgnid	String.
dsn	String. Name of database where tree, cond, and plot-level tables reside. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html).
pjoinid	String. Join variable in plot to match pltassgnid. Does not need to be uniqueid. If using most current XY coordinates for plot assignments, use identifier for plot (e.g., PLOT_ID).
areawt	String. Name of variable for summarizing area weights (e.g., CONDPROP_UNADJ).
adj	String. How to calculate adjustment factors for nonsampled (nonresponse) conditions based on summed proportions for by plot ('samp', 'plot'). 'samp' - adjustments are calculated at strata/estimation unit level; 'plot' - adjustments are calculated at plot-level. Adjustments are only calculated for annual inventory plots (DESIGNCD=1).
unitvar	String. Name of the estimation unit variable in unitarea and cond or pltassgn data frame with estimation unit assignment for each plot (e.g., 'ESTN_UNIT'). Optional if only one estimation unit.

unitarea	Numeric or DF. Total area by estimation unit. If only 1 estimation unit, include number of total acreage for the area of interest or a data frame with area and estimation unit. If more than one estimation unit, provide a data frame of total area by estimation unit, including unitvar and areavar.
areavar	String. Name of area variable in unitarea. Default="ACRES".
strata	Logical. If TRUE, include information for post-stratification.
stratalut	DF/DT. If strata=TRUE, look-up table with pixel counts or area by strata or proportion or area ('strwt') by strata (and estimation unit). If 'strwt' is not included, set getwt=TRUE and getwtvar as the name of variable to calculate weights from (e.g., pixel counts).
strvar	String. If strata=TRUE, name of the strata variable in stratalut and cond or pltassgn data frame with stratum assignment for each plot (Default = 'STRATUMCD').
savedata	Logical. If TRUE, saves table(s) to outfolder.
saveobj	Logical. If TRUE, saves returned list object to outfolder.
objnm	String. Name of *.rds object.
unit_opts	List. See help(unit_options()) for a list of options.
strata_opts	List. See help(strata_options()) for a list of options. Only used when strata = TRUE.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
GBdata	R List object. Output data list components from FIESTA::anGBdata().
pltdat	R List object. Output data list components from FIESTA::spGetPlots().
stratdat	R List object. Output data list components from FIESTA::spGetStrata().
auxdat	R List object. Output data list components from FIESTA::spGetAuxiliary().
gui	Logical. If gui, user is prompted for parameters.
...	For extendibility.

Details

Population types

popType	Description
ALL	Population data, including nonsampled plots.
CURR	Population data for area estimates, excluding nonsampled plots.
VOL	Population data for area/tree estimates, excluding nonsampled plots.
LULC	Population data for land use/land cover transitional estimates, including only plots with previous n

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot in tree table.
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	TPA_UNADJ	Number of trees per acre each sample tree represents (e.g., DESIGNCD=1: TPA_U
cond	cuniqueid	Unique identifier for each plot in cond table.
	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on eacl
pltassgn	pltassgnid	Unique identifier for each plot in pltassgn.
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

For available reference tables: sort(unique(FIESTAutils::ref_codes$VARIABLE))

Value

A list with population data for Green-Book estimates.

`condx`	Data frame. Condition-level data including plot-level assignment of estimation unit and stratum (if strata=TRUE), condition proportion adjustment factor (cadjfac), and adjusted condition proportions (CONDPROP_ADJ).
`cuniqueid`	String. Unique identifier of plot in condx and pltcondx.
`condid`	String. Unique identifier of condition in condx and pltcondx.
`treex`	Data frame. Tree data within population, used for estimation, including trees per acre adjustment factor (tadjfac), and adjusted trees per acre (TPA_ADJ) (if treef is included).
`tuniqueid`	String. Unique identifier of plot in treex (if treef is included).
`ACI.filter`	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1".
`unitarea`	String. Returned table of area by estimation unit.
`unitvar`	String. Variable name for estimation unit.
`strlut`	String. Strata-level table with pixel counts by strata (P1POINTCNT), strata weights (strwt), number of plots by strata (n.strata), total number of plots in estimation unit (n.total), sum of condition proportions (_UNADJ_SUM), area adjustments (*_ADJFAC), total area, and area expansion by strata (EXPNS).
`strvar`	String. Variable name for strata. If strata=FALSE, strvar="ONESTRAT".
`expcondtab`	String. If ACI=FALSE, ACI.filter="COND_STATUS_CD == 1".

plotsampcnt	Data frame. Number of plots by PLOT_STATUS_CD.
condsampcnt	Data frame. Number of conditions by COND_STATUS_CD.
states	String. State names in dataset.
invyrs	String. Range of inventory years in dataset.
stratdat	Data frame. Strata information by estimation unit.

Variable	Description
unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (i.e., strata weight)
CONDPROP_UNADJ_SUM	summed conditionproportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonsampled plots removed
AREA_USED	total area of estimation unit
expfac	strata-level expansion factor after nonsampled plots and conditions removed (AREA_USEI
EXPNS	strata-level area expansions (expfac * strwt)

Table(s) are also written to outfolder.

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. *PROP_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

unitcombine:
If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10.

If there are no estimation units following in order, it is combined with the estimation unit previous in order.

stratcombine:
If TRUE and less than 2 plots in any one strata class within an estimation unit, all strata classes with 2 or less plots are combined. The current method for combining is to group the strata with less than 2 plots with the strata class following in consecutive order (numeric or alphabetical), restrained by estimation unit (if unitcombine=FALSE), and continuing until the number of plots equals 10. If there are no strata classes following in order, it is combined with the estimation unit previous in order.

---

modWFtree *West-Fest module - Generate population data for WF module.*

Description

Generates population data for generating 'Westfall' Ratio2Size estimates.

Usage

```
modWFtree(
  WFpopdat,
  estvar,
  estvar.filter = NULL,
  estseed = "none",
  woodland = "Y",
  landarea = "FOREST",
  pcfilter = NULL,
  rowvar = NULL,
  colvar = NULL,
  sumunits = TRUE,
  returntitle = FALSE,
  savedata = FALSE,
  table_opts = NULL,
  title_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ...
)
```

Arguments

WFpopdat	List. Population data objects returned from FIESTA::modWFpop().
estvar	String. Name of the tree-level estimate variable (e.g., 'VOLCFNET').
estvar.filter	String. A tree-level filter for estvar. Must be R syntax (e.g., 'STATUSCD == 1').
estseed	String. Use seedling data only or add to tree data. Seedling estimates are only for counts (estvar='TPA_UNADJ')-('none', 'only', 'add').
woodland	String. If woodland = 'Y', include woodland tree species where measured. If woodland = 'N', only include timber species. See FIESTA::ref_species$WOODLAND ='Y/N'. If woodland = 'only', only include woodland species.
landarea	String. The condition-level filter for defining land area ('ALL', 'FOREST', 'TIMBERLAND'). If landarea='FOREST', COND_STATUS_CD = 1; if landarea='TIMBERLAND', SITECLCD in(1:6) & RESERVCD = 0.
pcfilter	String. A filter for plot or cond attributes (including pltassgn). Must be R logical syntax.
rowvar	String. Optional. Name of domain variable to group estvar by for rows in table output. Rowvar must be included in an input data frame (i.e., plt, cond, tree). If no rowvar is included, an estimate is returned for the total estimation unit. Include colvar for grouping by 2 variables.
colvar	String. Optional. If rowvar != NULL, name of domain variable to group estvar by for columns in table output. Colvar must be included in an input data frame (i.e., plt, cond, tree).
sumunits	Logical. If TRUE, estimation units are summed and returned in one table.
returntitle	Logical. If TRUE, returns title(s) of the estimation table(s).
savedata	Logical. If TRUE, saves table(s) to outfolder.
table_opts	List. See help(table_options()) for a list of options.
title_opts	List. See help(title_options()) for a list of options.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
gui	Logical. If gui, user is prompted for parameters.
...	Parameters for modWFpop() if WFpopdat is NULL.

Details

If variables are NULL, then it will prompt user to input variables.

Necessary variables:

Data	Variable	Description
tree	tuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).
	CONDID	Unique identifier of each condition on plot, to link to cond. Set CONDID=1, if onl
	TPA_UNADJ	Number of trees per acre each sample tree represents (ex. DESIGNCD=1: TPA_U
cond	cuniqueid	Unique identifier for each plot, to link to pltassgn (ex. PLT_CN).

	CONDID	Unique identifier of each condition on plot. Set CONDID=1, if only 1 condition pe
	CONDPROP_UNADJ	Unadjusted proportion of condition on each plot. Set CONDPROP_UNADJ=1, if c
	COND_STATUS_CD	Status of each forested condition on plot (i.e. accessible forest, nonforest, water, et
	NF_COND_STATUS_CD	If ACI=TRUE. Status of each nonforest condition on plot (i.e. accessible nonforest
	SITECLCD	If landarea=TIMBERLAND. Measure of site productivity.
	RESERVCD	If landarea=TIMBERLAND. Reserved status.
	SUBPROP_UNADJ	Unadjusted proportion of subplot conditions on each plot. Set SUBPROP_UNADJ
	MICRPROP_UNADJ	If microplot tree attributes. Unadjusted proportion of microplot conditions on each
	MACRPROP_UNADJ	If macroplot tree attributes. Unadjusted proportion of macroplot conditions on eacl
pltassgn	puniqueid	Unique identifier for each plot, to link to cond (ex. CN).
	STATECD	Identifies state each plot is located in.
	INVYR	Identifies inventory year of each plot.
	PLOT_STATUS_CD	Status of each plot (i.e. sampled, nonsampled). If not included, all plots are assume

For available reference tables: sort(unique(FIESTAutils::ref_codes$VARIABLE))

Value

A list with estimates with percent sampling error for rowvar (and colvar). If sumunits=TRUE or unitvar=NULL and colvar=NULL, one data frame is returned. Otherwise, a list object is returned with the following information. If savedata=TRUE, all data frames are written to outfolder.

`est`	Data frame. Tree estimates by rowvar, colvar (and estimation unit). If sumunits=TRUE or one estimation unit and colvar=NULL, estimates and percent sampling error are in one data frame.
`pse`	Data frame. Percent sampling errors (Confidence level 68 colvar (and estimation unit). Note: for 95 percent sampling error by 1.96.
`titlelst`	List with 1 or 2 string vectors. If returntitle=TRUE a list with table title(s). The list contains one title if est and pse are in the same table and two titles if est and pse are in separate tables.
`raw`	List of data frames. If rawdata=TRUE, a list including the processing data used for estimation including: number of plots and conditions; stratification information; and 1 to 8 tables with calculated values for table cells and totals (See processing data below).

Raw data

`plotsampcnt`	Table. Number of plots by plot status (ex. sampled forest on plot, sampled nonforest, nonsampled).
`condsampcnt`	DF. Number of conditions by condition status (forest land, nonforest land, noncensus water, census water, nonsampled).
`unitarea`	DF. Area by estimation unit.
`expcondtab`	DF. Condition-level area expansion factors.
`tdomdat`	DF. Final data table used for estimation.
`stratdat`	Data frame. Strata information by estimation unit.

Variable	Description
unitvar	estimation unit
strvar	stratum value
strwtvar	number of pixels by strata and estimation unit
n.strata	number of plots in strata (after totally nonsampled plots removed)
n.total	number of plots for estimation unit
strwt	proportion of area (or plots) by strata and estimation unit (i.e., strata weight)
CONDPROP_UNADJ_SUM	summed condition proportion by strata and estimation unit
CONDPROP_ADJFAC	adjusted condition proportion by strata after nonsampled plots removed

`processing data`

Data frames. Separate data frames containing calculated variables used in estimation process. The number of processing tables depends on the input parameters. The tables include: total by estimation unit (unit.totest); rowvar totals (unit.rowest), and if colvar is not NULL, colvar totals, (unit.colvar); and a combination of rowvar and colvar (unit.grpvar). If sumunits=TRUE, the raw data for the summed estimation units are also included (totest, rowest, colest, grpest, respectively). These tables do not included estimate proportions (nhat and nhat.var).

The data frames include the following information:

Variable	Description
nhat	estimated proportion of trees
nhat.var	variance estimate of estimated proportion of trees
NBRPLT.gt0	Number of non-zero plots used in estimates
ACRES	total area for estimation unit
est	estimated area of trees nhat*ACRES
est.var	variance estimate of estimated area of trees nhat.var*areavar^2
est.se	standard error of estimated area of trees sqrt(est.var)
est.cv	coefficient of variation of estimated area of trees est.se/est
pse	percent sampling error of estimate est.cv*100
CI99left	left tail of 99 percent confidence interval for estimated area
CI99right	right tail of 99 percent confidence interval for estimated area
CI95left	left tail of 95 percent confidence interval for estimated area
CI95right	right tail of 95 percent confidence interval for estimated area
CI67left	left tail of 67 percent confidence interval for estimated area
CI67right	right tail of 67 percent confidence interval for estimated area

Table(s) are also written to outfolder.

Note

ADJUSTMENT FACTOR:
The adjustment factor is necessary to account for nonsampled conditions. It is calculated for each estimation unit by strata. by summing the unadjusted proportions of the subplot, microplot, and macroplot (i.e. *PROP_UNADJ) and dividing by the number of plots in the strata/estimation unit).

An adjustment factor is determined for each tree based on the size of the plot it was measured on. This is identified using TPA_UNADJ as follows:

PLOT SIZE	TPA_UNADJ
SUBPLOT	6.018046
MICROPLOT	74.965282
MACROPLOT	0.999188

If ACI=FALSE, only nonsampled forest conditions are accounted for in the adjustment factor.
If ACI=TRUE, the nonsampled nonforest conditions are removed as well and accounted for in adjustment factor. This is if you are interested in estimates for all lands or nonforest lands in the All-Condition-Inventory.

sumunits:
An estimation unit is a population, or area of interest, with known area and number of plots. Individual counties or combined Super-counties are common estimation units for FIA. An estimation unit may also be a subpopulation of a larger population (e.g., Counties within a State). Subpopulations are mutually exclusive and independent within a population, therefore estimated totals and variances are additive. For example, State-level estimates are generated by summing estimates from all subpopulations within the State (Bechtold and Patterson. 2005. Chapter 2). Each plot must be assigned to only one estimation unit.

If sumunits=TRUE, estimates are generated by estimation unit, summed together, and returned as one estimate. If rawdata=TRUE, estimates by individual estimation unit are also returned.

If sumunits=FALSE, estimates are generated and returned by estimation unit as one data frame. If savedata=TRUE, a separate file is written for each estimation unit.

stratcombine:
If TRUE and less than 2 plots in any one estimation unit, all estimation units with 10 or less plots are combined. The current method for combining is to group the estimation unit with less than 10 plots with the estimation unit following in consecutive order (numeric or alphabetical), restrained by survey unit (UNITCD) if included in dataset, and continuing until the number of plots equals 10. If there are no estimation units following in order, it is combined with the estimation unit previous in order.

rowlut/collut:
There are several objectives for including rowlut/collut look-up tables: 1) to include descriptive names that match row/column codes in the input table; 2) to use number codes that match row/column names in the input table for ordering rows; 3) to add rows and/or columns with 0 values for consistency. No duplicate names are allowed.

Include 2 columns in the table:
1-the merging variable with same name as the variable in the input merge table;
2-the ordering or descriptive variable.
If the ordering variable is the rowvar/colvar in the input table and the descriptive variable is in rowlut/collut, set row.orderby/col.orderby equal to rowvar/colvar. If the descriptive variable is the rowvar/colvar in the input table, and the ordering code variable is in rowlut/collut, set row.orderby/col.orderby equal to the variable name of the code variable in rowlut/collut.

UNITS:
The following variables are converted from pounds (from FIA database) to short tons by multiplying

the variable by 0.0005. DRYBIO_AG, DRYBIO_BG, DRYBIO_WDLD_SPP, DRYBIO_SAPLING, DRYBIO_STUMP, DRYBIO_TOP, DRYBIO_BOLE, DRYBIOT, DRYBIOM, DRYBIOTB, JBIOTOT, CARBON_BG, CARBON_AG

MORTALITY:
For Interior-West FIA, mortality estimates are mainly based on whether a tree has died within the last 5 years of when the plot was measured. If a plot was remeasured, mortality includes trees that were alive the previous visit but were dead in the next visit. If a tree was standing the previous visit, but was not standing in the next visit, no diameter was collected (DIA = NA) but the tree is defined as mortality.

Common tree filters:

FILTER	DESCRIPTION
"STATUSCD == 1"	Live trees
"STATUSCD == 2"	Dead trees
"TPAMORT_UNADJ > 0"	Mortality trees
"STATUSCD == 2 & DIA >= 5.0"	Dead trees >= 5.0 inches diameter
"STATUSCD == 2 & AGENTCD == 30"	Dead trees from fire

`popFilters` *Population data filters.*

Description

Returns a list of user-supplied parameters and parameter values for population data filters.

Usage

```
popFilters(
  evalid = NULL,
  states = NULL,
  evalCur = FALSE,
  evalEndyr = NULL,
  measCur = FALSE,
  measEndyr = NULL,
```

```
  invyrs = NULL,
  measyrs = NULL,
  intensity = NULL,
  ACI = FALSE,
  AOIonly = FALSE,
  ...
)
```

Arguments

evalid	Numeric. FIA Evaluation identifier for subsetting plots for population.
states	String or numeric vector. Name (e.g., 'Arizona','New Mexico') or code (e.g., 4, 35) of state(s) for evalid. If all states in one or more FIA Research Station is desired, set states=NULL and use RS argument to define RS.
evalCur	Logical. If TRUE, the most current FIA Evaluation is extracted for state(s).
evalEndyr	Number. The end year of the FIA Evaluation of interest. Selects only sampled plots and conditions for the evaluation period. If more than one state, create a named list object with evalEndyr labeled for each state (e.g., list(Utah=2014, Colorado=2013).
measCur	Logical. If TRUE, the most current sampled plots available for state(s).
measEndyr	Number. The most current sampled plots measured before or during end given..
invyrs	Integer vector. Inventory year(s) (e.g., c(2000, 2001, 2002)).
measyrs	Integer vector. Measurement year(s) (e.g., c(2000, 2001, 2002)).
intensity	Integer code. Code(s) indicating intensity to use for population.
ACI	Logical. If TRUE, including All Condition Inventory (ACI) plots.
AOIonly	Logical. If TRUE, and there is an AOI (1/0) attribute in the population data, only AOI=1 are used for estimation.
...	For extendibility.

Details

If no parameters, an empty list is returned.

Value

A list of user-supplied parameters and parameter values for population data filters.

Author(s)

Grayson W. White

Examples

```
popFilters(ACI = TRUE)
```

popTableIDs *List of population table unique IDs.*

Description

Returns a list of user-supplied parameters and parameter values for data table unique IDs to be supplied to *pop functions.

Usage

```
popTableIDs(
  cond = "PLT_CN",
  plt = "CN",
  tree = "PLT_CN",
  seed = "PLT_CN",
  seedling = "PLT_CN",
  vsubpspp = "PLT_CN",
  p2veg_subplot_spp = "PLT_CN",
  vsubpstr = "PLT_CN",
  p2veg_subp_structure = "PLT_CN",
  invsubp = "PLT_CN",
  invasive_subplot_spp = "PLT_CN",
  subplot = "PLT_CN",
  subp_cond = "PLT_CN",
  dwm = "PLT_CN",
  cond_dwm_calc = "PLT_CN",
  sccm = "PLT_CN",
  subp_cond_chng_mtrx = "PLT_CN",
  grm = "PLT_CN",
  tree_grm_component = "PLT_CN",
  begin = "PLT_CN",
  tree_grm_begin = "PLT_CN",
  midpt = "PLT_CN",
  tree_grm_midpt = "PLT_CN",
  pltu = "PLT_CN",
  condu = "PLT_CN",
  ...
)
```

Arguments

cond	String. Unique identifier of plot in cond.
plt	String. Unique identifier of plot in plt.
tree	String. Unique identifier of plot in tree and seed.
seed	String.
seedling	String.

vsubpspp String.
p2veg_subplot_spp String.
vsubpstr String.
p2veg_subp_structure String.
invsubp String.
invasive_subplot_spp String.
subplot String.
subp_cond String.
dwm String.
cond_dwm_calc String.
sccm String.
subp_cond_chng_mtrx String.
grm String.
tree_grm_component String.
begin String.
tree_grm_begin String.
midpt String.
tree_grm_midpt String.
pltu String.
condu String.
... For extendibility.

Details

If no parameters, an empty list is returned.

Value

A list of user-supplied parameters and parameter values for strata.

Author(s)

Grayson W. White

Examples

```
popTableIDs(cond = "my_unique_id", tree = "my_tree_id")
```

popTables *List of population tables.*

Description

Returns a list of user-supplied parameters and parameter values for data tables to be supplied to *pop functions.

Usage

```
popTables(
  cond = "COND",
  plt = "PLOT",
  tree = "TREE",
  seed = "SEEDLING",
  seedling = "SEEDLING",
  vsubpspp = "P2VEG_SUBPLOT_SPP",
  p2veg_subplot_spp = "P2VEG_SUBPLOT_SPP",
  vsubpstr = "P2VEG_SUBP_STRUCTURE",
  p2veg_subp_structure = "P2VEG_SUBP_STRUCTURE",
  invsubp = "INVASIVE_SUBPLOT_SPP",
  invasive_subplot_spp = "INVASIVE_SUBPLOT_SPP",
  subplot = "SUBPLOT",
  subp_cond = "SUBP_COND",
  dwm = "COND_DWM_CALC",
  cond_dwm_calc = "COND_DWM_CALC",
  sccm = "SUBP_COND_CHNG_MTRX",
  subp_cond_chng_mtrx = "SUBP_COND_CHNG_MTRX",
  grm = "TREE_GRM_COMPONENT",
  tree_grm_component = "TREE_GRM_COMPONENT",
  begin = "TREE_GRM_BEGIN",
  tree_grm_begin = "TREE_GRM_BEGIN",
  midpt = "TREE_GRM_MIDPT",
  tree_grm_midpt = "TREE_GRM_MIDPT",
  pltu = "pltu",
  condu = "condu",
  ...
)
```

Arguments

cond	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Condition-level data with one record for each condition, including or excluding nonsampled conditions. Plot variables and strata/estimation unit variable(s) may be included if plt and pltassgn=NULL. See details for necessary variables to include.
plt	DF/DT, Optional. R object, sf R object, comma-delimited file(*.csv), layer or spatial layer in dsn, or shapefile(*.shp). Plot-level data with one record for each

plot, including or excluding nonsampled conditions. If nonsampled plots are included, PLOT_STATUS_CD variable must be in table or a filter defined in plt.nonsamp.filter.

`tree` DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Tree-level data with one record for each tree. Tree data are aggregated to condition-level. See details for necessary variables to include.

`seed` DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Seedling data with one record for each seedling count.

`seedling` DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Seedling data with one record for each seedling count.

`vsubpspp` DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Vegetation species-level data with one record for each species (P2VEG_SUBPLOT_SPP).

`p2veg_subplot_spp`
DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Vegetation species-level data with one record for each species (P2VEG_SUBPLOT_SPP).

`vsubpstr` DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Vegetation species-structure data with one record for each species (P2VEG_SUBP_STRUCTURE).

`p2veg_subp_structure`
DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Vegetation species-structure data with one record for each species (P2VEG_SUBP_STRUCTURE).

`invsubp` DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Invasive species data with one record for each species (INVASIVE_SUBPLOT_SPP).

`invasive_subplot_spp`
DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Invasive species data with one record for each species (INVASIVE_SUBPLOT_SPP).

`subplot` DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Subplot-level data with one record for each species (SUBPLOT).

`subp_cond` DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Subplot condition-level data with one record for each species (SUBP_COND).

`dwm` DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Calculated down woody material (COND_DWM_CALC).

`cond_dwm_calc` DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Calculated down woody material (COND_DWM_CALC).

`sccm` DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Subplot-level data (SUBP_COND_CHNG_MTRX).

`subp_cond_chng_mtrx`
DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Subplot-level data (SUBP_COND_CHNG_MTRX).

`grm` DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Tree-level growth, removal, and mortality data (TREE_GRM_COMPONENT).

`tree_grm_component`
DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Tree-level growth, removal, and mortality data (TREE_GRM_COMPONENT).

begin	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Tree-level growth, removal, and mortality data (TREE_GRM_BEGIN).
tree_grm_begin	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Tree-level growth, removal, and mortality data (TREE_GRM_BEGIN).
midpt	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Tree-level growth, removal, and mortality data (TREE_GRM_MIDPT).
tree_grm_midpt	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Tree-level growth, removal, and mortality data (TREE_GRM_MIDPT).
pltu	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Plot data unioned with remeasured plot data.
condu	DF/DT, R object, comma-delimited file(*.csv), or layer in dsn. Cond data unioned with remeasured cond data.
...	For extendibility.

Details

If no parameters, an empty list is returned.

Value

A list of user-supplied parameters and parameter values for strata.

```

Format

An object of class `data.frame` with 47 rows and 5 columns.

Source

Units table.

spClassifyRast *Data - Reclass raster.*

Description

Wrapper to reclass a raster using a vector of cut breaks.

Usage

```
spClassifyRast(
  rastfn,
  cutbreaks,
  bnd = NULL,
  bnd_dsn = NULL,
  bnd.filter = NULL,
  buffdist = NULL,
  nodataclass = NULL,
  gethist = FALSE,
  savedata_opts = NULL
)
```

Arguments

rastfn	String. Path name of raster to classify.
cutbreaks	Integer vector. Breaks to use for classifying (e.g., c(0,50,75) uses function in calc: 'ifelse (A >= 0 & A < 50, 1, ifelse (A >= 50 & A < 75, 2, ifelse (A >= 75, 3, 255)))'
bnd	sf R object or String. Boundary to clip raster (optional). Can be a spatial sf object, full pathname to a shapefile, or name of a layer within a database.
bnd_dsn	String. Name of data source name with bnd_layer, if in a database.
bnd.filter	String. Optional filter of bnd_layer.
buffdist	Number. The distance to buffer the polygon before clipping raster, in units of raster.
nodataclass	Integer. Class number to assign NODATA values to.
gethist	Logical. If TRUE, returns a histogram of pixel values by class.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.

Value

Data.

Author(s)

Tracey S. Frescino

---

spClipPoint *Spatial - Clip (intersect) point vector layer with polygon vector layer.*

Description

Wrapper for sf::st_intersection, to clip (intersect) point vector layer with a polygon vector layer.

Usage

```
spClipPoint(
  xyplt,
  xyplt_dsn = NULL,
  uniqueid = "PLT_CN",
  clippolyv,
  clippolyv_dsn = NULL,
  clippolyv.filter = NULL,
  buffdist = NULL,
  validate = FALSE,
  showext = FALSE,
  keepNA = FALSE,
```

```
  returnsp = TRUE,
  othertabnms = NULL,
  stopifnotin = TRUE,
  savedata = FALSE,
  exportsp = FALSE,
  spMakeSpatial_opts = NULL,
  savedata_opts = NULL
)
```

Arguments

xyplt	sf R object or String. Point data to clip. Can be a spatial points object, full pathname to a shapefile, or name of a layer within a database.
xyplt_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of layer to clip. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html).
uniqueid	String.* Unique identifier of xyplt rows.
clippolyv	sf R object or String. Name of clipping polygon spatial polygon object, full path to shapefile, or name of a layer within a database.
clippolyv_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of clipping polygon. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html)
clippolyv.filter	String. Filter to subset clippolyv spatial layer.
buffdist	Number. The distance to buffer the polygon before clipping. Uses sf::st_buffer. The distance is based on units of polygon, st_crs(x)$units.
validate	Logical. If TRUE, validates polyv and clippolyv before clipping. Uses sf::st_make_valid with default parameters (geos_method='valid_structure', geos_keep_collapsed=FALSE).
showext	Logical. If TRUE, layer extents are displayed in plot window.
keepNA	Logical. If TRUE, keep NA values after data intersection.
returnsp	Logical. If TRUE, returns sf object of points. If FALSE, returns data frame of points (i.e., drops sf geometry).
othertabnms	String vector. Name(s) of R objects, comma-delimited files, or database layers to subset. Must include quotes (e.g., othertabnms=c("tree", "cond")).
stopifnotin	Logical. If TRUE, stops if boundaries do not overlap. If FALSE, returns NULL.
savedata	Logical. If TRUE, save data to outfolder.
exportsp	Logical. If TRUE, the clipped spatial point data are exported.
spMakeSpatial_opts	List. See help(spMakeSpatial_options()) for a list of options. Use to convert X/Y values to simple feature (sf) coordinates.
savedata_opts	List. See help(savedata_options()) for a list of options for saving data. If out_layer = NULL, default = 'pntclip'.

Details

The sf::st_intersection function is used to clip points.

If the projection of clippolyv is not the same as the xyplt, the xyplt layer layer will be reprojected to the same projection as the clippoly before intersection.

Value

A list of the following objects:

clip_xyplt	sf object. The input xyplt, clipped to polygon boundary layer. The projection will be same as clippolyv projection.
xy.uniqueid	String. Unique identifier of clip_xy.
clip_polyv	SpatialPolygonsDataFrame. The polygon boundary layer used for clipping.
clip_tabs	Data frame(s). Other tables in intabs clipped to boundary.

If exportsp=TRUE, the sf object will be written to out_dsn (See note).

Note

On-the-fly projection conversion
The spTransform (sf) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

ESRI Shapefile Driver
If exportsp=TRUE:
The st_write (sf) function is called. If out_fmt="shp", the ESRI Shapefile driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If sf object has more than 1 record, it will be returned but not exported.

Examples

```
# Get point data from WYplt data in FIESTA
WYplt <- FIESTA::WYplt

# Get polygon vector layer from FIESTA external data
WYbhdistfn <- system.file("extdata",
                          "sp_data/WYbighorn_districtbnd.shp",
                          package = "FIESTA")
```

```
# Extract points from polygon vector layer
xyext <- spClipPoint(xyplt = WYplt,
                     clippolyv = WYbhdistfn,
                     clippolyv.filter = "DISTRICTNU == '03'",
                     uniqueid = "CN",
                     spMakeSpatial_opts = list(xvar = "LON_PUBLIC",
                                               yvar = "LAT_PUBLIC",
                                               xy.crs = 4269))
names(xyext)
xyplt <- xyext$clip_xyplt
polyv <- xyext$clip_polyv

# Plot extracted values of national forest district
plot(sf::st_geometry(polyv))
plot(sf::st_geometry(xyplt), add = TRUE)
```

---

spClipPoly *Spatial - Clip (intersect) polygon vector layer with polygon vector layer.*

Description

Wrapper for sf::st_intersection, to clip (intersect) polygon vector layer with another polygon vector layer.

Usage

```
spClipPoly(
  polyv,
  polyv_dsn = NULL,
  clippolyv,
  clippolyv_dsn = NULL,
  clippolyv.filter = NULL,
  buffdist = NULL,
  validate = FALSE,
  showext = FALSE,
  areacalc = FALSE,
  areaunits = "ACRES",
  nolonglat = TRUE,
  exportsp = FALSE,
  savedata_opts = NULL
)
```

Arguments

polyv	sf R object or String. Polygon data to clip. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.

polyv_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of layer to clip. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if polyv is sf object.
clippolyv	SpatialPolygons class R object or String. Name of the polygon spatial layer to use for clipping.
clippolyv_dsn	String. Data source name (dsn; i.e., pathname or database name) of clippolyv_layer. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if clippolyv_layer is an R object.
clippolyv.filter	String. Filter to subset clippolyv spatial layer.
buffdist	Number. The distance to buffer the polygon before clipping. Uses sf::st_buffer. The distance is based on units of polygon, st_crs(x)$units.
validate	Logical. If TRUE, validates polyv and clippolyv before clipping. Uses sf::st_make_valid with default parameters (geos_method='valid_structure', geos_keep_collapsed=FALSE).
showext	Logical. If TRUE, layer extents are displayed in plot window.
areacalc	Logical. If TRUE, calculate area of clipped polygons and append to attribute table (See details).
areaunits	String. If TRUE, calculate area of clipped polygons and append to attribute table ("ACRES", "HECTARES", "SQKM"). If NULL, units of polyv.
nolonglat	Logical. If TRUE, and both layer's coordinate system is long/lat, the layers are converted to a projected CRS before clipping.
exportsp	Logical. If TRUE, the spatial clipped object is exported to outfolder (see spExportSpatial for details).
savedata_opts	List. See help(savedata_options()) for a list of options for saving data. If out_layer = NULL, default = 'polyclip'.

Details

The sf::st_intersection function is used to clip polygons.

areacalc
If areacalc = TRUE and the clipped spatial object is not in a projected coordinate system (i.e., longlat), the object will be reprojected to the Albers Equal Area projection before area is calculated.

Value

sf object of clipped polygon. If polyv and clippolyv have different projections, the projection of returned object will have the same projection as polyv (See note about on-the-fly projection conversion).

If exportsp=TRUE, the sf object will be written to outfolder (See note).

Note

On-the-fly projection conversion
The spTransform (sf) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in

the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

ESRI Shapefile Driver
If exportsp=TRUE:
The st_write (sf) function is called. If out_fmt="shp", the ESRI Shapefile driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If sf object has more than 1 record, it will be returned but not exported.

Examples

```
## Not run:
# Load in USAco data from geodata package
USAco <- geodata::gadm(country="United States", level=2, path=tempdir())

# Set up data from FIESTA
WYbhfn <- system.file("extdata", "sp_data/WYbighorn_adminbnd.shp",
                                    package = "FIESTA"))

# Clip polygon with WY Bighorn object from FIESTA
WYbhco <- spClipPoly(polyv = USAco,
                     clippolyv = WYbhfn)

## End(Not run)
```

---

spClipRast *Spatial - Subsets a raster to a polygon extent or boundary.*

Description

Subsets a raster to the extent or masked boundary of a spatial polygon object or shapefile (*.shp), with option to write the new file to the outfolder with specified format (fmt).

Usage

```
spClipRast(
  rast,
  rastfolder = NULL,
  clippolyv,
  clippolyv_dsn = NULL,
  clippolyv.filter = NULL,
  rast.crs = NULL,
```

```
  bands = NULL,
  NODATA = NULL,
  buffdist = NULL,
  validate = FALSE,
  maskByPolygons = TRUE,
  showext = FALSE,
  fmt = "GTiff",
  compress = FALSE,
  compressType = "DEFLATE",
  outfolder = NULL,
  outfn = "rastclip",
  outfn.pre = NULL,
  outfn.date = FALSE,
  overwrite = FALSE
)
```

Arguments

rast	String or Raster. Raster name, including extension. Option to include full path.
rastfolder	String. Name of the raster folder. Optional.
clippolyv	SpatialPolygons class R object or String. Name of the polygon spatial layer to use for clipping.
clippolyv_dsn	String. The data source name (dsn; i.e., pathname or database name) of clippolyv. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if polyv_layer is an R object.
clippolyv.filter	String. Filter to subset clippolyv spatial layer.
rast.crs	EPSG code or PROJ.4 string. Defined coordinate reference system if rast has no crs defined.
bands	Numeric vector. If rast is a multi-layer raster and only 1 or some layers are desired, specify layer number(s) in a vector format. If NULL, all layers are summed.
NODATA	Number. The NODATA value for background values. If NODATA is NULL, and a NODATA value is defined on the input raster, the default is the defined NODATA value, else it is defined based on its datatype (see DEFAULT_NODATA for default data values).
buffdist	Number. The distance to buffer the polygon before clipping raster. Uses sf::st_buffer. The distance is based on units of the raster.
validate	Logical. If TRUE, validates polyv and clippolyv before clipping. Uses sf::st_make_valid with default parameters (geos_method='valid_structure', geos_keep_collapsed=FALSE).
maskByPolygons	Logical. If TRUE, rast is clipped to boundary of polygon. If FALSE, rast is clipped to extent of polygon.
showext	Logical. If TRUE, layer extents are displayed in plot window.
fmt	String. Format for exported raster. Default is format of unput raster. ("raster", "ascii", "SAGA", "IDRISI", "CDF", "GTiff", "ENVI", "EHdr", "HFA", "VRT"). VRT is a virtual raster (See note below).

compress	Logical. If TRUE, compress the final output.
compressType	String. An optional compression type ('LZW', "DEFLATE', "PACKBITS'). Note: If format = 'HFA', a default compression type is used.
outfolder	String. The output folder.
outfn	String. Name of output data file. If NULL, default is 'rastclip'. If no extension, a default is provided to match output format.
outfn.pre	String. Add a prefix to output name (e.g., "01").
outfn.date	Logical. If TRUE, add date to end of outfile (e.g., outfn_'date'.csv).
overwrite	Logical. If TRUE, overwrite files in outfolder.

Details

Use spClipRast() to prompt for input.

If the projection of polyv is different than the projection of rast, the polyv SpatialPolygons object is converted to the projection of rast (See note about on-the-fly projection conversion).

Value

value	Spatial S4 object. A clipped raster file.

The clipped raster is written to outfolder with specified format or same format as input raster.

Note

On-the-fly projection conversion
The spTransform (sf) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

VRT format Virtual raster format is a pointer to a temporary file, commonly used as an intermediate step between processes. The VRT format ignores option to maskByPolygons.

Examples

```
# Get polygon vector layer from FIESTA external data
WYbhdistfn <- system.file("extdata",
                          "sp_data/WYbighorn_districtbnd.shp",
                          package = "FIESTA")
WYbhdist <- FIESTA::spImportSpatial(WYbhdistfn)
WYbhdist
```

```
# Get raster layers from FIESTA external data
demfn <- system.file("extdata",
                     "sp_data/WYbighorn_dem_250m.img",
                     package = "FIESTA")

# Clip raster to district = '03'
dem03 <- spClipRast(rast = demfn,
                    clippolyv = WYbhdistfn,
                    clippolyv.filter = "DISTRICTNU == '03'",
                    overwrite = TRUE,
                    outfolder = tempdir())
terra::plot(terra::rast(dem03))

# Clip raster to district = '06'
dem06 <- spClipRast(rast = demfn,
                    clippolyv = WYbhdistfn,
                    clippolyv.filter = "DISTRICTNU == '06'",
                    overwrite = TRUE,
                    outfolder = tempdir())

# Plot extracted values of national forest district
terra::plot(terra::rast(dem06))
```

---

spExportSpatial *Spatial - Exports an sf object.*

Description

Exports an sf object to a specified output.

Usage

```
spExportSpatial(sfobj, savedata_opts = NULL)
```

Arguments

sfobj	sf class R object. Spatial object to export.
savedata_opts	List. See help(savedata_options()) for a list of options for saving data. If out_layer = NULL, default = 'datsp'.

Details

Wrapper for sf::st_write function.

Value

An sf spatial object is written to outfolder.

Note

If out_fmt='shp':
The ESRI shapefile driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). Name changes are output to the outfolder, 'out_layer'_newnames.csv.

If sf object has more than 1 record, it cannot be exported to a shapefile.

Author(s)

Tracey S. Frescino

Examples

```
# Set up data from FIESTA
WYbh <- spImportSpatial(system.file("extdata",
                                    "sp_data/WYbighorn_adminbnd.shp",
                                    package = "FIESTA"))

# Export data with spExportSpatial
spExportSpatial(WYbh,
                savedata_opts = list(out_dsn = "WYbh.shp",
                                     outfolder = tempdir(),
                                     overwrite_dsn = TRUE))
```

---

spExtractPoly *Spatial - Extracts point attribute values from SpatialPolygons layer(s).*

Description

Extracts values from one or more polygon layers and appends to input SpatialPoints layer or data frame. Points are reprojected on-the-fly to projection of SpatialPolygons using PROJ.4 transformation parameters and sf spTransform function.

Usage

```
spExtractPoly(
  xyplt,
  xyplt_dsn = NULL,
  xy.uniqueid = "PLT_CN",
  polyvlst,
  polyv_dsn = NULL,
  polyvarlst = NULL,
  polyvarnmlst = NULL,
  keepNA = FALSE,
  showext = FALSE,
  savedata = FALSE,
  exportsp = FALSE,
```

```
  exportNA = FALSE,
  spMakeSpatial_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE,
  ncores = NULL
)
```

Arguments

xyplt	Data frame object or String. Name of layer with xy coordinates and unique identifier. Can be layer with xy_dsn, full pathname, including extension, or file name (with extension) in xy_dsn folder.
xyplt_dsn	String. Name of database where xyplt is. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html).
xy.uniqueid	String.* Unique identifier of xyplt rows.
polyvlst	sf R object or String. Name(s) of polygon layers to extract values. A spatial polygon object, full path to shapefile, or name of a layer within a database.
polyv_dsn	String. Data source name (dsn) where polyvlst layers are found (e.g., *.sqlite, *.gdb, folder name). The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html).
polyvarlst	String vector or list. The name(s) of variable(s) to extract from polygon(s). If extracting multiple variables from more than one polygon, specify names in a list format, corresponding to polyvlst.
polyvarnmlst	String vector or list. Output name(s) of variable(s) extracted from polygon(s). If extracting multiple variables from more than one polygon, specify names in a list format, corresponding to polyvlst. The number of names must match the number of variables in polyvarlst.
keepNA	Logical. If TRUE, keep NA values.
showext	Logical. If TRUE, layer extents are displayed in plot window.
savedata	Logical. If TRUE, the input data with extracted values are saved to outfolder.
exportsp	Logical. If TRUE, the extracted point data are exported to outfolder.
exportNA	Logical. If TRUE, NULL values are exported to outfolder.
spMakeSpatial_opts	List. See help(spMakeSpatial_options()) for a list of options. Use to convert X/Y values to simple feature (sf) coordinates.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'polyext'.
gui	Logical. If gui, user is prompted for parameters.
ncores	Integer. Number of cores to use for extracting values.

Details

*If variable = NULL, then it will prompt user for input.

keepnull
If keepnull=FALSE, points are excluded when all extracted variables from any one SpatialPolygons are NULL, returning the points that fall within the ' intersecting polygons.

Value

pltdat	SpatialPointsDataFrame object or data frame. Input point data with extracted raster values appended. For multi-part polygons, more than 1 row per point may be output.
var.name	String vector. Variable names of extracted variables.

If savedata=TRUE, outdat data frame is saved to outfolder (Default name: datext_'date'.csv). If exportsp=TRUE, the SpatialPointsDataFrame object is exported to outfolder (Default name: datext_'date'.shp). Variable names are truncated to 10 characters or less (See note below). Name changes are output to 'outfn'_newnames_'data'.csv in outfolder.

Note

If exportshp=TRUE:
The st_write (sf) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

The spTransform (sf) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

Any names in polygon layers that are the same as in xyplt are renamed to name'_1'.

# Get point data from WYplt data in FIESTA
WYplt <- FIESTA::WYplt

# Get polygon vector layer from FIESTA external data
WYbhdistfn <- system.file("extdata",
                          "sp_data/WYbighorn_districtbnd.shp",
                          package = "FIESTA")

# Extract points from polygon vector layer
xyext <- spExtractPoly(xyplt = WYplt,
                       polyvlst = WYbhdistfn,
                       xy.uniqueid = "CN",
                       spMakeSpatial_opts = list(xvar = "LON_PUBLIC",
                                                 yvar = "LAT_PUBLIC",
                                                 xy.crs = 4269))
names(xyext)
xyext$outnames
spxyext <- xyext$spxyext
```

```
head(spxyext)
NAlst <- xyext$NAlst

# Plot extracted values of national forest district
plot(spxyext["DISTRICTNU"])
```

---

spExtractRast *Spatial - Extracts point attribute values from raster layer(s).*

Description

Extracts values from one or more raster layers and appends to input SpatialPoints layer or data frame. Points are reprojected on-the-fly to projection of raster(s) using PROJ.4 transformation parameters and sf spTransform function. Includes options to use bilinear interpolation or summarize over a window of n pixels using a specified statistic.

Usage

```
spExtractRast(
  xyplt,
  xyplt_dsn = NULL,
  xy.uniqueid = "PLT_CN",
  rastlst,
  rastfolder = NULL,
  rast.crs = NULL,
  bandlst = NULL,
  var.name = NULL,
  interpolate = FALSE,
  windowsize = 1,
  windowstat = NULL,
  rast.NODATA = NULL,
  keepNA = TRUE,
  ncores = 1,
  showext = FALSE,
  savedata = FALSE,
  exportsp = FALSE,
  exportNA = FALSE,
  spMakeSpatial_opts = NULL,
  savedata_opts = NULL,
  gui = FALSE
)
```

Arguments

xyplt	Data frame object or String. Name of layer with xy coordinates and unique identifier. Can be layer with xy_dsn, full pathname, including extension, or file name (with extension) in xy_dsn folder.

xyplt_dsn	String. Name of database where xyplt is. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html).
xy.uniqueid	String. Unique identifier of xyplt rows.
rastlst	String vector or list or strings and/or rasters. File name(s) with extensions, or raster object(s). Note: raster objects must be written to file.
rastfolder	String. Name of the folder with raster layers. Optional. Useful if all raster layers are in same folder.
rast.crs	EPSG code or PROJ.4 String. Name of coordinate reference system for rasters with no projection defined. If more than one raster has no projection defined, the same crs will be used.
bandlst	Numeric named list. If rastfnlst includes a multi-layer raster and only 1 or some layers are desired, specify layer numbers in a named list format with names matching the base names in rastfnlst (e.g., list(rast1=5, rast3=1:3)). If NULL, all layers are extracted.
var.name	String vector. Extracted variable name(s). If NULL, uses the basename of raster layer, including band number for multi-band rasters.
interpolate	Logical vector. If TRUE, uses bilinear interpolation of pixel values, weighted average of 4 nearest pixels (i.e., continuous data).
windowsize	Number vector. The size of window for summarizing data.
windowstat	Character vector. If windowsize is greater than one, the statistic to use for summarizing data ("mean", "min", "max", "median", "sum", "range", "var", "sd", "rsd", "mode", "value"). If windowstat="value", all pixel values are returned, otherwise 1 value per row in xyplt is returned.
rast.NODATA	Numeric vector. NODATA value(s) of raster if not predefined (See notes below). This value will be converted to NA and removed if keepNA=FALSE. If rastfnlst includes more than one raster, the rast.NODATA value should coincide with number of rasters in rastfnlst. If only one rast.NODATA, the same NODATA value is used for all rasters.
keepNA	Logical. If TRUE, keeps NA values after data extraction.
ncores	Integer. Number of cores to use for extracting values.
showext	Logical. If TRUE, layer extents are displayed in plot window.
savedata	Logical. If TRUE, the input data with extracted values are saved to outfolder.
exportsp	Logical. If TRUE, the extracted raster point data are exported to outfolder.
exportNA	Logical. If TRUE, NA values are exported to outfolder.
spMakeSpatial_opts	List. See help(spMakeSpatial_options()) for a list of options. Use to convert X/Y values to simple feature (sf) coordinates.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'rastext'.
gui	Logical. If gui, user is prompted for parameters.

Details

*If variable = NULL, then it will prompt user for input.

Value

sppltext	sf object or data frame. Input xyplt data with extracted raster values appended.
outnames	String vector. Raster output names.
rastfnlst	String vector. Raster pathnames.
inputdf	Data frame. Raster information input to zonal summaries.
NAlst	sf List. If NA values exist after data extraction, the spatial NA points are returned.

If savedata=TRUE, pltassgn and unitarea are saved to outfolder.
If exportsp=TRUE, the spatial sf points object is exported to outfolder.
. If exportNA=TRUE and NA values exist after data extraction, the spatial NA points are exported to outfolder.

Note

rast.NODATA
NODATA values are raster pixel values that have no data of interest, including pixels within the extent of the layer, but outside the area of interest. Sometimes these pixels have been defined previously. The defined NODATA pixels are imported to R as NULL values. When not previously defined, the pixels outside the area of interest will be the minimum or maximum value depending on the data type (e.g., 16-bit signed: min=-32,768; max=32,768) or byte size (1 byte: min=0; max=255). These NODATA values will be added to the zonal statistic calculations if not specified in rast.NODATA.

The spTransform (sf) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

```

`spGetAuxiliary` *Spatial wrapper - Extracts and compiles auxiliary data within a specified boundary.*

Description

Wrapper to extract and compile auxiliary data by domain unit (i.e, estimation unit or small area domain). The following information is compiled:
- Attribute defining domain (i.e., estimation unit) from domain layer
- Area by domain (i.e., estimation unit)
- Zonal statistics by domain (i.e., estimation unit) - spZonalRast()

Usage

```
spGetAuxiliary(
  xyplt = NULL,
  xyplt_dsn = NULL,
  uniqueid = "PLT_CN",
  unittype = "POLY",
  unit_layer = NULL,
  unit_dsn = NULL,
  unitvar = NULL,
  unitvar2 = NULL,
  rastlst.cont = NULL,
  rastlst.cont.name = NULL,
  rastlst.cont.stat = "mean",
  rastlst.cont.NODATA = NULL,
  rastlst.cat = NULL,
```

```
  rastlst.cat.name = NULL,
  rastlst.cat.NODATA = NULL,
  rastfolder = NULL,
  asptransform = FALSE,
  rast.asp = NULL,
  rast.lut = NULL,
  rastlut = NULL,
  extract = TRUE,
  areacalc = TRUE,
  areaunits = "ACRES",
  keepNA = TRUE,
  ncores = 1,
  NAto0 = TRUE,
  npixels = TRUE,
  addN = FALSE,
  showext = FALSE,
  returnxy = FALSE,
  savedata = FALSE,
  exportsp = FALSE,
  exportNA = FALSE,
  spMakeSpatial_opts = NULL,
  savedata_opts = NULL,
  vars2keep = NULL,
  gui = FALSE
)
```

Arguments

xyplt	Data frame object or String. Name of layer with xy coordinates and unique identifier. Can be layer with xy_dsn, full pathname, including extension, or file name (with extension) in xy_dsn folder.
xyplt_dsn	String. Name of database where xyplt is. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html).
uniqueid	String.* Unique identifier of xyplt records.
unittype	String. Type of spatial layer unit_layer is ("POLY", "RASTER").
unit_layer	sf R object or String. Name of the domain spatial layer. Can be a spatial polygon object, full pathname to a shapefile, name of a polygon layer within a database, or a full pathname to raster file.
unit_dsn	String. The data source name (dsn; i.e., folder or database name) of unit_layer. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional.
unitvar	String. Name of domain variable in domlayer. If NULL, assuming one domain. An attribute names ONEUNIT is added to layer with value=1.
unitvar2	String. If unittype="POLY", name of attribute in unit_layer defining a second, hierarchical larger, estimation unit (e.g., Statecd).

rastlst.cont String vector or list. A list of raster(s) with continuous data values (e.g., DEM). The list may include file name of raster(s) or raster objects that are not InMemory.

rastlst.cont.name
String vector. Output names for continuous rasters. Optional. If NULL, name of raster is used as default or name+'_'+layer number for multi-band layers.

rastlst.cont.stat
String. Zonal statistic for continuous rasters.

rastlst.cont.NODATA
Numeric vector. NODATA value for continuous rasters (See notes). These values will be converted to NA and removed from output if keepNA=FALSE. If 1 number, the same value will be used for all categorical rasters. If more than 1 number, the number of values must be equal to the number of rasters in rastlst.cont.

rastlst.cat String vector or list. A list of raster(s) with thematic (i.e., categorical) data values. The list may include file name of raster(s) or raster objects that are not InMemory.

rastlst.cat.name
String vector. Output names for categorical rasters. If NULL, name of raster is used as default or name+'_'+layer number for multi-band layers.

rastlst.cat.NODATA
Numeric vector. NODATA value for categorical rasters (See notes). These values will be converted to NA and removed from output if keepNA=FALSE. If 1 number, the same value will be used for all categorical rasters. If more than 1 number, the number of values must be equal to the number of rasters in rastlst.cat.

rastfolder String. Name of the folder with raster layers. Optional. Useful if all raster layers are in same folder.

asptransform Logical. If TRUE, transforms aspect to Northness and Eastness indices using sin and cosine functions.

rast.asp String or raster object. The raster in rastlst.cont that is the aspect raster (Note: aspect must have units in degrees).

rast.lut String. A raster in rastlst.cat to group class values. Only one raster is allowed.

rastlut String or raster object. The raster look up table used for collapsing rast.lut values.

extract Logical. If TRUE, extracts values from rastlst.cont and rastlst.cat along with values from unit_layer. If FALSE, extracts only values from unit_layer.

areacalc Logical. If TRUE, returns area by domvar.

areaunits String. Output area units ("ACRES", "HECTARES", "SQMETERS").

keepNA Logical. If TRUE, returns data frame of NA values.

ncores Integer. Number of cores to use for extracting values.

NAto0 Logical. If TRUE, converts extracted NA values to 0.

npixels Logical. If TRUE, include number of pixels.

addN	Logical. If TRUE, adds N to unitzonal output with number of plots by unit.
showext	Logical. If TRUE, layer extents are displayed in plot window.
returnxy	Logical. If TRUE, returns xy data as sf object (spxyplt).
savedata	Logical. If TRUE, the input data with extracted values are saved to outfolder.
exportsp	Logical. If savedata=TRUE and returnxy=TRUE, If TRUE, the extracted strata point data are exported to outfolder.
exportNA	Logical. If TRUE, NA values are exported to outfolder.
spMakeSpatial_opts	List. See help(spMakeSpatial_options()) for a list of options. Use to convert X/Y values to simple feature (sf) coordinates.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
vars2keep	String vector. Attributes in SAdoms, other than domvar to include in unitzonal output and extract to pltassgn points.
gui	Logical. If gui, user is prompted for parameters.

Details

*If variable = NULL, then it will prompt user for input.

If there is a raster and SpatialPolygon layer, and the projection of the SpatialPolygons is different than the projection of the raster, the SpatialPolygons object is reprojected to the projection of raster (See note about on-the-fly projection conversion).

Value

pltassgn	sf object. xyplt data with extracted values from rastlst*.
unitzonal	Data frame. Number of pixels and zonal statistics from continuous rasters or zonal proportions from categorical raster for each domain (i.e., estimation unit).
unitvar	Data frame. Domain (i.e., estimation unit) name.
inputdf	Data frame. Raster information input to zonal summaries.
prednames	String vector. Name(s) of predictor variable(s).
zonalnames	String vector. Name(s) of zonal variable(s).
predfac	String vector. Name(s) of categorical (i.e. factor) variable(s).
npixelvar	String. Name of variable describing number of pixels.
unitarea	Data frame. Area by domain (i.e., estimation unit).
areavar	String. Name of variable describing acres in domarea.
pltassgnid	String. Unique identifier of plot.
spxy	Simple feature. If returnxy=TRUE, Spatial coordinates.
xy.uniqueid	String. If returnxy=TRUE, unique identifier of spxy.

If savedata=TRUE, datstrat and unitarea are saved to outfolder. If exportsp=TRUE, the sf object is exported to outfolder.

Note

rast.NODATA
NODATA values are raster pixel values that have no data of interest, including pixels within the extent of the layer, but outside the area of interest. Sometimes these pixels have been defined previously. The defined NODATA pixels are imported to R as NULL values. When not previously defined, the pixels outside the area of interest will be the minimum or maximum value depending on the data type (e.g., 16-bit signed: min=-32,768; max=32,768) or byte size (1 byte: min=0; max=255). These NODATA values will be added to the zonal statistic calculations if not specified in rast.NODATA.

If exportsp=TRUE:
If out_fmt="shp", the st_write (sf) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

On-the-fly projection conversion
The spTransform (sf) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

Examples

```
# Get layers from FIESTA external data
## dem (continuous)
demfn <- system.file("extdata",
                     "sp_data/WYbighorn_dem_250m.img",
                     package = "FIESTA")

## tnt (categorical)
tntfn <- system.file("extdata",
                     "sp_data/WYbighorn_forest_nonforest_250m.tif",
                     package = "FIESTA")

## unit layer
WYbhdistfn <- system.file("extdata",
                          "sp_data/WYbighorn_districtbnd.shp",
                          package = "FIESTA")
# Get Auxiliary data
spGetAuxiliary(xyplt = FIESTA::WYplt,
               uniqueid = "CN",
               unit_layer = WYbhdistfn,
               unitvar = "DISTRICTNA",
               rastlst.cont = demfn,
```

```
                rastlst.cat = tntfn,
                spMakeSpatial_opts = list(xvar = "LON_PUBLIC",
                                          yvar = "LAT_PUBLIC"))
```

---

spGetEstUnit *Spatial wrapper - Extracts point attribute values and area from a simple feature or raster estimation unit layer.*

Description

Wrapper to get point attribute values and area from a simple feature or raster layer of estimation units and calculates area. Points are reprojected on-the-fly to projection of unit_layer using PROJ.4 transformation parameters and sf spTransform function. - Point attribute extraction from simple feature (spExtractPoly) or from raster (spExtractRast) - Calculate area by estimation unit(s) (areacalc.poly/areacalc.pixel)

Usage

```
spGetEstUnit(
  xyplt,
  xyplt_dsn = NULL,
  uniqueid = "PLT_CN",
  unittype = "POLY",
  unit_layer,
  unit_dsn = NULL,
  unitvar = NULL,
  unit.filter = NULL,
  areavar = NULL,
  areaunits = "acres",
  keepNA = FALSE,
  returnxy = FALSE,
  showext = FALSE,
  savedata = FALSE,
  exportsp = FALSE,
  exportNA = FALSE,
  spMakeSpatial_opts = NULL,
  savedata_opts = NULL,
  vars2keep = NULL,
  gui = FALSE
)
```

Arguments

xyplt	Data frame, sf object, full pathname to *.csv or *shp, or layer name in a geodatabase. Includes XY coordinates and unique identifier. If non-spatial, include options in spMakeSpatial_opts parameter.

xyplt_dsn	String. Name of database where xyplt is. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html).
uniqueid	String.* Unique identifier of xyplt rows.
unittype	String. Spatial layer type of unit_layer ("POLY", "RASTER").
unit_layer	String or sf object. The name of the estimation unit layer. The layer name may be a full pathname to a file, the basename to a file, a spatial layer name from a database, or a SpatialPolygons object with a defined projection.
unit_dsn	String. The data source name (dsn; i.e., folder or database name) of unit_layer. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional.
unitvar	String. Name of estimation unit variable in unit_layer.
unit.filter	String. Filter to subset unit_layer spatial layer.
areavar	String. Name of area variable unit variable in unit_layer. If NULL, calculates area by unitvar.
areaunits	String. Output area units ("acres", "hectares", "sqmeters").
keepNA	Logical. If TRUE, returns data frame of NA values.
returnxy	Logical. If TRUE, returns xy data as sf object (spxyplt).
showext	Logical. If TRUE, layer extents are displayed in plot window.
savedata	Logical. If TRUE, the input data with extracted values are saved to outfolder.
exportsp	Logical. If TRUE, the extracted strata point data are exported to outfolder.
exportNA	Logical. If TRUE, NA values are exported to outfolder.
spMakeSpatial_opts	List. See help(spMakeSpatial_options()) for a list of options. Use to convert X/Y values to simple feature (sf) coordinates.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
vars2keep	String vector. Attributes in SAdoms, other than domvar to include in dunitlut output and extract to pltassgn points.
gui	Logical. If gui, user is prompted for parameters.

Details

*If variable = NULL, then it will prompt user for input.

If there is a raster and simple feature layer, and the projection of the simple feature is different than the projection of the raster, the simple feature object is transformed to the projection of raster (See note about on-the-fly projection conversion).

Value

pltunit	Data frame. Input point data with extracted estimation unit and strata values appended.
sppltunit	SpatialPointsDataframe. Spatial point data with extracted estimation unit values appended.

unitarea	Data frame. Area by estimation unit.
unitvar	Data frame. Variable name for estimation unit in unitarea.
acrevar	Data frame. Variable name for area in unitarea.
pltassgnid	String. Unique identifier of plot.

If savedata=TRUE, pltstrat and unitarea are saved to outfolder (Default name: *_'date'.csv). If exportshp=TRUE, the SpatialPointsDataFrame object is exported to outfolder (Default name: datext_'date'.shp). Variable names are truncated to 10 characters or less (See note below). Name changes are output to 'outfn'_newnames_'data'.csv in outfolder.

Note

If exportsp=TRUE:
If out_fmt="shp", the st_write (sf) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

On-the-fly projection conversion
The spTransform (sf) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

unitarea
Area by estimation unit is calculated and returned as object named unitarea. Area is based on the projection of unit_layer. If no unit_layer input, than area is calculated from pixel counts.

spGetPlots *Spatial wrapper - Extracts plot data within a given boundary.*

Description

Wrapper to get FIA plots within the boundary population (area of interest) - Intersect with state boundary - Get FIA plots for intersected states, including tree, and spatial - Clip spatial coordinates and other tables to boundary (spClipPoint)

Usage

```
spGetPlots(
  bnd = NULL,
  bnd_dsn = NULL,
  bnd.filter = NULL,
  states = NULL,
  RS = NULL,
  pltids = NULL,
  xy_datsource = NULL,
  xy_dsn = NULL,
  xy = "PLOT",
  xy_opts = xy_options(),
  datsource = NULL,
  data_dsn = NULL,
  dbTabs = dbTables(),
  eval = "FIA",
  eval_opts = NULL,
  puniqueid = "CN",
  invtype = "ANNUAL",
  intensity1 = FALSE,
  clipxy = TRUE,
  pjoinid = NULL,
  showsteps = FALSE,
  returnxy = TRUE,
  returndata = TRUE,
  savedata = FALSE,
  savexy = FALSE,
  savebnd = FALSE,
  exportsp = FALSE,
  savedata_opts = NULL,
  spXYdat = NULL,
  gui = FALSE,
  ...
)
```

Arguments

bnd	sf R object, Area of Interest (AOI) boundary. Can be a spatial sf object, full pathname to a shapefile, or name of a layer within a database.
bnd_dsn	String. Data source name (dsn; e.g., SQLite database or shapefile pathname) of bnd. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if bnd is an R object.
bnd.filter	String. Filter to subset bnd spatial layer.
states	String. The name of state(s) for tables (e.g., "Vermont", "Utah").
RS	String. Name of FIA research station to restrict states to ('RMRS','SRS','NCRS','NERS','PNWRS'). If NULL, all research stations are included.
pltids	Data frame. Non-spatial plot identifiers within bnd).
xy_datsource	String. Source of XY data ("obj", "csv", "datamart", "sqlite"). If datsource=NULL, checks extension of xy_dsn or xy to identify datsource.
xy_dsn	String. Data source name (dsn; i.e., pathname or database name) of xy. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if bnd_layer is an R object.
xy	sf R object or String. Table with xy coordinates. Can be a spatial polygon object, data frame, full pathname to a shapefile, or name of a layer within a database.
xy_opts	List of xy data options to specify if xy is NOT NULL. See xy_options (e.g., xy_opts = list(xvar='LON', yvar='LAT').
datsource	String. Source of FIA data ("obj", "csv", "datamart", "sqlite"). If datsource="sqlite", specify database name in data_dsn and layers in *_layer arguments. If datsource="datamart", files are downloaded and extracted from FIA DataMart (http://apps.fs.usda.gov/fia/dat See details for more information about plot coordinates. If datsource="csv", specify *.csv file names in *_layer arguments.
data_dsn	String. Name of database where *_layers reside.
dbTabs	List of database tables the user would like returned. See help(dbTables) for a list of options.
eval	String. Type of evaluation time frame for data extraction ('FIA', 'custom'). See eval_opts for more further options.
eval_opts	List of evaluation options for 'FIA' or 'custom' evaluations to determine the set of data returned. See help(eval_options) for a list of options.
puniqueid	String. Name of unique identifier of plt.
invtype	String. Type of FIA inventory to extract ('PERIODIC', 'ANNUAL'). Only one inventory type (PERIODIC/ANNUAL) at a time.
intensity1	Logical. If TRUE, includes only XY coordinates where INTENSITY = 1 (FIA base grid).
clipxy	Logical. If TRUE, clips xy data to bnd.
pjoinid	String. Variable in plt to join to XY data. Not necessary to be unique. If using most current XY coordinates, use identifier for a plot (e.g., PLOT_ID).
showsteps	Logical. If TRUE, display data in device window.
returnxy	Logical. If TRUE, save xy coordinates to outfolder.

returndata	Logical. If TRUE, returns data objects.
savedata	Logical. If TRUE, saves data to outfolder.
savexy	Logical. If TRUE, saves XY data to outfolder.
savebnd	Logical. If TRUE, and savedata=TRUE, saves bnd. If out_fmt='sqlite', saves to a SpatiaLite database.
exportsp	Logical. If TRUE, and savexy=TRUE, saves xy data as spatial data. If FALSE, saves xy data as table.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
spXYdat	R list object. Output from spGetXY().
gui	Logical. If TRUE, uses gui interface.
...	parameters passed to DBgetPlots().

Details

datsource

Plots are extracted from 3 different data sources:
1) CSV - data have previously been extracted from the FIA database and stored as CSV files.
2) datamart - data are extracted from FIA's publically-available datamart.
3) sqlite - data have previously been extracted from the FIA database and stored within a SQLite database.

Selection parameters

FIA plots are selected based on the following parameters:

evalid - the FIA evaluation identifier
evalCur - the most current FIA evaluation in database
evalEndyr - the FIA evaluation ending in evalEndyr
evalType - the FIA evaluation type ('ALL', 'AREAVOL', 'GRM', 'P2VEG', 'DWM', 'INV', 'REGEN', 'CRWN')
measCur - the most current measurement of each plot in database
measEndyr - the most current measuremtn of each plot in database in or prior to measEndyr
Endyr.filter - a filter for bnd that specifies the boundary where measEndyr should be applied

Value

xypltx	sf object. Input xy data clipped to boundary.
bndx	sf object. Input bnd.
tabs	list object. List of input layers clipped to boundary (pltx,condx,etc.).
xy.uniqueid	String. Name of unique identifier of xy.
puniqueid	String. Name of unique identifier of plot in plt.
pjoinid	String. Name of unique identifier of plot in plt.

If savedata=TRUE, outdat data frame is saved to outfolder.

Note

If savebnd=TRUE:
If out_fmt=c('csv','shp'), the st_write (sf) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

If datsource="datmart", data are imported from FIA DataMart. The plot coordinates have been altered for privacy (See https://www.fia.fs.fed.us/tools-data/spatial/Policy/index.php for details). The zip files are extracted on-the-fly from the online website. Web server connections will affect download speeds.

```

spGetSAdoms *Spatial wrapper - Generate a set of model domain units for Small Area Estimation (SAE) strategies.*

Description

Spatial process to generate a set of model domains (i.e., helper polygons) for Small Area Estimation (SAE) strategies. If helper_autoselect=TRUE, an automated process is used to select helper polygons within a large area overlapping the small area. The helper polygons are unioned with the small area polygons, resulting in a set of model domains that can be used for SAE.

Usage

```
spGetSAdoms(
  smallbnd,
  smallbnd_dsn = NULL,
  smallbnd.unique = NULL,
  smallbnd.domain = NULL,
  smallbnd.filter = NULL,
  smallbnd.stfilter = NULL,
  helperbnd = NULL,
  helperbnd_dsn = NULL,
  helperbnd.unique = NULL,
  helperbnd.filter = NULL,
  largebnd = NULL,
  largebnd_dsn = NULL,
  largebnd.unique = NULL,
  largebnd.filter = NULL,
  maxbnd = NULL,
  maxbnd_dsn = NULL,
  maxbnd.unique = NULL,
  maxbnd.filter = NULL,
  helper_autoselect = TRUE,
  nbrdom.min = NULL,
  maxbnd.threshold = 10,
  largebnd.threshold = 5,
  multiSAdoms = FALSE,
  showsteps = TRUE,
  savedata = FALSE,
  savesteps = FALSE,
  saveobj = FALSE,
  objnm = "SAdomdat",
  maxbnd.addtext = TRUE,
  largebnd.addtext = FALSE,
  savedata_opts = NULL,
  addstate = FALSE,
  dissolve = FALSE,
```

```
  byeach = FALSE
)
```

Arguments

smallbnd	sf R object or String. Small area of interest boundary. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
smallbnd_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of smallbnd. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if smallbnd is an R object.
smallbnd.unique	String. The attribute in smallbnd that defines unique domain identifier in smallbnd that defines the unique small area(s). If NULL, an attribute is appended to smallbnd attribute table and used as smallbnd.unique, defining one polygon (SMALLAREA="SMALLAREA").
smallbnd.domain	String. A different attribute to use as for grouped modeling domains (optional). If NULL, smallbnd.domain=smallbnd.unique.
smallbnd.filter	String. A filter for smallbnd. Must be R syntax.
smallbnd.stfilter	String. A spatial filter for smallbnd to include only smallbnd polygons that intersect (or overlap >= 30 boundary. The filter is based on the stunitco internal R object, with attributes: STATECD, STATENM, UNITCD, UNITNM, COUNTYCD, COUNTYNM. The filter should include one of these attributes and must be R syntax.
helperbnd	sf R object or String. Name of polygon spatial layer delineating helper polygons for small area models. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
helperbnd_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of helperbnd. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if helperbnd is an R object.
helperbnd.unique	String. The attribute in helper polygon layer that defines unique helper polygons.
helperbnd.filter	String. A filter for helperbnd. Must be R syntax.
largebnd	sf R object or String. Name of large area polygon spatial layer, defining the model data extent for building small are models. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
largebnd_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of largebnd. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if largebnd is an R object.
largebnd.unique	String. The attribute in largebnd polygon layer that defines unique large area polygon(s).

largebnd.filter
: String. A filter for largebnd. Must be R syntax.

maxbnd
: sf R object or String. Name of polygon spatial layer, defining the maximum model data restraint for adding more helper polygons for building small are models. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.

maxbnd_dsn
: String. Data source name (dsn; e.g., sqlite or shapefile pathname) of maxbnd. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if maxbnd is an R object.

maxbnd.unique
: String. The attribute in maxbnd polygon layer that defines unique max restraint area(s).

maxbnd.filter
: String. A filter for maxbnd. Must be R syntax.

helper_autoselect
: Logical. If TRUE, the helper boundaries are automatically selected based on intersection with maxbnd and/or largebnd and number of helperbnds defined by nbrdom.min.

nbrdom.min
: Integer. Set number for minimum domains for modeling. If NULL, all domains within largebnd are selected.

maxbnd.threshold
: Integer. Percent for including additional maxbnds for selecting helperbnds. If multiSAdoms=FALSE, the maxbnd with greatest percentage over the maxbnd.threshold is selected.

largebnd.threshold
: Integer. Percent for including additional largebnds for selecting helperbnds.

multiSAdoms
: Logical. If TRUE, and the percent intersect of smallbnd with maxbnd is greater than maxbnd.threshold, more than 1 SAdoms will be output in list.

showsteps
: Logical. If TRUE, intermediate steps of selection process are displayed.

savedata
: Logical. If TRUE, save SAdoms spatial layer to outfolder.

savesteps
: Logical. If TRUE, save steps spatial intermediate layers and JPG images. All spatial layers are output as *.shp format in a separate folder (SAdoms_steps).

saveobj
: Logical. If TRUE, save SAdomdat object to outfolder.

objnm
: String. Name of *.rds object.

maxbnd.addtext
: Logical. If TRUE, adds text to intermediate step plots for maxbnd displays.

largebnd.addtext
: Logical. If TRUE, adds text to intermediate step plots for largebnd displays.

savedata_opts
: List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.

addstate
: Logical. If TRUE, appends state attribute to SAdoms.

dissolve
: Logical. If TRUE, aggregates polygons to smallbnd.domain or smallbnd.unique.

byeach
: Logical. If TRUE, creates an SAdom for each smallbnd polygon.

Details

optional boundaries

The helperbnd, largebnd, and maxbnd are optional. If helperbnd=NULL, the smallbnd polygons are used for model domain units. If largebnd=NULL, the maxbnd is used to define the large area. If maxbnd=NULL, the largebnd is used to restrain the model extent. If both, largebnd=NULL and maxbnd=NULL, the extent of the smallbnd or helperbnd is used for defining and restraining the model extent.

nbrdom.min

The number of helper polygons selected are defined by nbrdom.min parameter. If nbrdom.min=NULL, all helper polygons within the large area extent are selected.

multiSAdoms

Use multiSAdoms parameter when small area of interest has multiple polygon features and the small area polygons overlap (within maxbnd.threshold) more than one maxbnd polygon. If multiSAdoms=TRUE, more than one set of model domain units are generated; one for each maxbnd where overlap is within maxbnd.threshold. If multiSAdoms=FALSE, only one set of model domain units are generated, using the maxbnd with the greatest overlap.

AOI attribute

A variable named 'AOI' is appended to the SAdoms attribute table to distinguish between the small area of interest polygons and the helper domain units.

Value

`SAdomslst` List object. Set(s) of model domain units. If multiSAdoms=TRUE, the list may have more than one set of model domain units.

`smallbndlst` List object. smallbnd(s). If multiSAdoms=TRUE, the list may have more than one set of smallbnd.

If exportsp=TRUE, the SAdoms spatial object(s) is exported to outfolder, with format specified by out_fmt.

Note

If exportsp=TRUE and out_fmt="shp":
The st_write (sf) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

The spTransform (sf) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

spGetStates *Spatial wrapper - Extracts states that intersect a boundary.*

Description

Wrapper to get state names that intersect a given boundary.

Usage

```
spGetStates(
  bnd_layer,
  bnd_dsn = NULL,
  bnd.filter = NULL,
  stbnd.att = "COUNTYFIPS",
  RS = NULL,
  states = NULL,
  overlap = 1,
  showsteps = FALSE,
  savebnd = FALSE,
  savedata_opts = NULL
)
```

Arguments

bnd_layer	sf R object, Area of Interest (AOI) boundary. Can be a spatial sf object, full pathname to a shapefile, or name of a layer within a database.
bnd_dsn	String. Data source name (dsn; e.g., SQLite database or shapefile pathname) of bnd. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html).
bnd.filter	String. Filter to subset bnd spatial layer.
stbnd.att	String. Attribute in stunitco to output ('STATECD', 'STATENM', 'COUNTYFIPS').
RS	String. Name of FIA research station to restrict states to ('RMRS','SRS','NCRS','NERS','PNWRS'). If NULL, all research stations are included.
states	String. States to subset boundary to.
overlap	Number. Percent overlap to include.
showsteps	Logical. If yes, display intersecting boundaries.
savebnd	Logical. If yes, save boundary to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savebnd = TRUE.

Value

A list containing states and state names that the boundary crosses, and boundary and attribute information for the intersecting boundary.

Author(s)

Tracey S. Frescino

Examples

```
# Get polygon vector layer from FIESTA external data
WYbhdistfn <- system.file("extdata",
                          "sp_data/WYbighorn_districtbnd.shp",
                          package = "FIESTA")

# Get intersecting statenames
spGetStates(WYbhdistfn)$statenames

# Get intersecting COUNTYFIP codes
spGetStates(WYbhdistfn,
            stbnd.att = "COUNTYFIPS")$states
```

---

spGetStrata *Spatial wrapper - Extracts point attribute values and pixel counts for strata and estimation unit spatial layers.*

Description

Wrapper to extract attribute and area from a polygon or raster estimation unit layer and a polygon or raster layer with strata pixel categories.

Usage

```
spGetStrata(
  xyplt,
  xyplt_dsn = NULL,
  unit_layer,
  unit_dsn = NULL,
  uniqueid = "PLT_CN",
  unitvar = NULL,
  unitvar2 = NULL,
  unit.filter = NULL,
  strattype = "RASTER",
  strat_layer = NULL,
  strat_dsn = NULL,
  strvar = NULL,
  strat_lut = NULL,
  areaunits = "acres",
  rast.NODATA = NULL,
  keepNA = FALSE,
  ncores = 1,
  showext = FALSE,
  returnxy = FALSE,
```

```
  savedata = FALSE,
  exportsp = FALSE,
  exportNA = FALSE,
  spMakeSpatial_opts = NULL,
  savedata_opts = NULL,
  vars2keep = NULL,
  gui = FALSE
)
```

Arguments

xyplt	Data frame, sf object, full pathname to *.csv or *shp, or layer name in a geodatabase. Includes XY coordinates and unique identifier. If non-spatial, include options in spMakeSpatial_opts parameter.
xyplt_dsn	String. Name of database where xyplt is. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html).
unit_layer	sf R object or String. Name of estimation unit spatial layer. Can be a spatial polygon object, full pathname to a shapefile, name of a polygon layer within a database, or a full pathname to raster file.
unit_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of unit_layer. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if unit_layer is sf object.
uniqueid	String.* Unique identifier of xyplt records. Note: raster unit layers are converted to polygon.
unitvar	String. If unittype="POLY", name of attribute in unit_layer defining estimation units. If NULL, the unit_layer represents one estimation unit.
unitvar2	String. If unittype="POLY", name of attribute in unit_layer defining a second, hierarchical larger, estimation unit (e.g., Statecd).
unit.filter	String. Filter to subset unit_layer spatial layer.
strattype	String. Spatial layer type of strat_layer ("POLY", "RASTER"). Note: polygon strata layers are converted to raster.
strat_layer	sf R object or full pathname of spatial stratification layer. Can be a spatial polygon object, full pathname to a shapefile, name of a polygon layer within a database, or a full pathname to raster file.
strat_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of strat_layer. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if unit_layer is sf object.
strvar	String. If strattype="POLY", name of strata attribute in strat_layer.
strat_lut	Data frame. A look-up table of codes to aggregate. The format of table includes 2 columns, one column same name as strvar. If strattype="RASTER", strvar="value".
areaunits	String. Output area units ("acres", "hectares", "sqmeters").
rast.NODATA	Numeric. NODATA value if stratlayer is raster (See notes). This values will be converted to NA and removed from output. if keepNA=TRUE, NA values will not be in included in stratalut but will remain in pltassgn table.

keepNA	Logical. If TRUE, returns data frame of NA values.
ncores	Integer. Number of cores to use for extracting values.
showext	Logical. If TRUE, layer extents are displayed in plot window.
returnxy	Logical. If TRUE, returns xy data as sf object (spxyplt).
savedata	Logical. If TRUE, the input data with extracted values are saved to outfolder.
exportsp	Logical. If savedata=TRUE and returnxy=TRUE, If TRUE, the extracted strata point data are exported to outfolder.
exportNA	Logical. If TRUE and keepNA=TRUE, NA values are exported to outfolder as a point shapefile.
spMakeSpatial_opts	List. See help(spMakeSpatial_options()) for a list of options. Use to convert X/Y values to simple feature (sf) coordinates.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.
vars2keep	String vector. Attributes in SAdoms, other than domvar to include in dunitlut output and extract to pltassgn points.
gui	Logical. If gui, user is prompted for parameters.

Details

*If variable = NULL, then it will prompt user for input.

If spatial layers have different projections, the polygon spatial layer is transformed to the projection of raster (See note about on-the-fly projection conversion). If both layers are long/lat coordinate system, they are transformed to default coordinate system (Conus Albers, NAD83).

Value

pltassgn	Data frame. Input xyplt data with extracted estimation unit and strata values appended.
unitarea	Data frame. Area by estimation unit.
unitvar	Data frame. Variable name for estimation unit in unitarea.
acrevar	Data frame. Variable name for area in unitarea.
stratalut	Data frame. Strata proportions (weights) by estimation unit and strata.
strvar	Data frame. Variable name for strata values in stratalut.
NAlst	sf List. If keepNA=TRUE, and NA values exist after data extraction, the spatial NA points are returned.
pltassgnid	String. Unique identifier of plot.
spxy	Simple feature. If returnxy=TRUE, Spatial coordinates.
xy.uniqueid	String. If returnxy=TRUE, unique identifier of spxy.

If savedata=TRUE, pltassgn and unitarea are saved to outfolder.
If exportsp=TRUE, the spatial sf points object is exported to outfolder.
. If exportNA=TRUE and NA values exist after data extraction, the spatial NA points are exported to outfolder.

Note

rast.NODATA
NODATA values are raster pixel values that have no data of interest, including pixels within the extent of the layer, but outside the area of interest. Sometimes these pixels have been defined previously. The defined NODATA pixels are imported to R as NULL values. When not previously defined, the pixels outside the area of interest will be the minimum or maximum value depending on the data type (e.g., 16-bit signed: min=-32,768; max=32,768) or byte size (1 byte: min=0; max=255). These NODATA values will be added to the zonal statistic calculations if not specified in rast.NODATA.

If exportsp=TRUE:
If out_fmt="shp", the st_write (sf) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

On-the-fly projection conversion
The spTransform (sf) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

unitarea
Area by estimation unit is calculated and returned as object named unitarea. Area is based on the projection of unit_layer. If no unit_layer input, than area is calculated from pixel counts.

polygon to raster
If strattype="POLY", a raster template is created based on the masked extent of strat_layer, with strat_layer projected coordinate system and 30 meter pixel size.

Examples

```
# Create a `SpatialPoints` object from `WYplt`
WYspplt <- spMakeSpatialPoints(xyplt = WYplt,
                               xy.uniqueid = "CN",
                               xvar = "LON_PUBLIC",
                               yvar = "LAT_PUBLIC",
                               xy.crs = 4269)

# Set up stratification from object in `FIESTA`
fornffn <- system.file("extdata",
                       "sp_data/WYbighorn_forest_nonforest_250m.tif",
                       package = "FIESTA")

# Set up data from FIESTA
WYbhfn <- system.file("extdata",
```

```
                      "sp_data/WYbighorn_adminbnd.shp",
                      package = "FIESTA")

# Run `spGetStrata`
spGetStrata(WYspplt,
            uniqueid = "CN",
            unit_layer = WYbhfn,
            strattype = "RASTER",
            strat_layer = fornffn)
```

---

spGetXY *Spatial wrapper - Extracts XY coordinates within a given boundary.*

Description

Wrapper to get FIA plots within the boundary population (area of interest) - Intersect with state boundary - Get FIA plots for intersected states, including tree, and spatial - Clip spatial coordinates and other tables to boundary (spClipPoint)

Usage

```
spGetXY(
  bnd,
  bnd_dsn = NULL,
  bnd.filter = NULL,
  states = NULL,
  RS = NULL,
  xy_datsource,
  xy_dsn = NULL,
  xy = "PLOT",
  xy_opts = xy_options(),
  datsource = NULL,
  data_dsn = NULL,
  dbTabs = dbTables(),
  eval = "FIA",
  eval_opts = NULL,
  pjoinid = "CN",
  invtype = "ANNUAL",
  intensity1 = FALSE,
  pvars2keep = NULL,
  bndvars2keep = NULL,
  clipxy = TRUE,
  showsteps = FALSE,
  returnxy = TRUE,
  savedata = FALSE,
  exportsp = FALSE,
  savedata_opts = NULL
)
```

Arguments

bnd	sf R object, Area of Interest (AOI) boundary. Can be a spatial sf object, full pathname to a shapefile, or name of a layer within a database.
bnd_dsn	String. Data source name (dsn; e.g., SQLite database or shapefile pathname) of bnd. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if bnd is an R object.
bnd.filter	String. Filter to subset bnd spatial layer.
states	String. The name of state(s) for tables (e.g., "Vermont", "Utah").
RS	String. Name of FIA research station to restrict states to ('RMRS','SRS','NCRS','NERS','PNWRS'). If NULL, all research stations are included.
xy_datsource	Source of XY data ('datamart', 'sqlite', 'obj', 'csv').
xy_dsn	If datsource='sqlite', the file name (data source name) of the sqlite database (*.db) where XY data reside.
xy	sf R object or String. If xy_dsn = 'datamart', name of xy table in FIA DataMart. If xy_dsn = 'sqlite', name of xy layer in database. If datsource = 'csv', full pathname of xy CSV file(s). If datsource = 'obj', name of xy R object. If datsource = 'shp', full pathname of shapefile.
xy_opts	List of xy data options for xy (e.g., xy_opts = list(xvar='LON', yvar='LAT'). See xy_options() for more options and defaults.
datsource	String. Source of FIA data for defining FIA evaluations or appending variables ('datamart', 'sqlite', 'obj', 'csv'). If datsource = NULL, datsource = xy_datsource. If datsource = 'datamart', data are downloaded extracted from FIA DataMart (http://apps.fs.usda.gov/fia/datamart/datamart.html). If datsource='sqlite', specify database name(s) in data_dsn and table name(s) in dbTabs() argument. If datsource = ('obj','csv'), specify *.csv file name in dbTabs argument.
data_dsn	String. Name of database with plot_layer and/or ppsa_layer.
dbTabs	String or R Object. If data_dsn = 'datamart', name of table(s) in FIA DataMart. If data_dsn = 'sqlite', name of layer(s) in database. If datsource = 'csv', name of CSV file(s). If datsource = 'obj', name of R object.
eval	String. Type of evaluation time frame for data extraction ('FIA', 'custom'). See eval_opts for more further options.
eval_opts	List of evaluation options for 'FIA' or 'custom' evaluations to determine the set of data returned. See help(eval_options) for a list of options.
pjoinid	String. Variable in plt to join to XY data. Not necessary to be unique. If using most current XY coordinates, use identifier for a plot (e.g., PLOT_ID).
invtype	String. Type of FIA inventory to extract ('PERIODIC', 'ANNUAL'). Only one inventory type (PERIODIC/ANNUAL) at a time.
intensity1	Logical. If TRUE, includes only XY coordinates where INTENSITY = 1 (FIA base grid).
pvars2keep	String vector. One or more variables in plot table to append to output.
bndvars2keep	String vector. One or more variables in bnd to append to output.
clipxy	Logical. If TRUE, clips xy data to bnd.

showsteps	Logical. If TRUE, display data in device window.
returnxy	Logical. If TRUE, returns XY coordinates.
savedata	Logical. If TRUE, saves data to outfolder. Note: includes XY data if returnxy = TRUE.
exportsp	Logical. If savedata = TRUE and returnxy = TRUE, if TRUE, exports XY data as spatial data.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE.

Details

datsource

Plots are extracted from 3 different data sources:
1) CSV - data have previously been extracted from the FIA database and stored as CSV files.
2) datamart - data are extracted from FIA's publically-available datamart.
3) sqlite - data have previously been extracted from the FIA database and stored within a SQLite database.

Selection parameters

FIA plots are selected based on the following parameters:

evalid - the FIA evaluation identifier
evalCur - the most current FIA evaluation in database
evalEndyr - the FIA evaluation ending in evalEndyr
evalType - the FIA evaluation type ('ALL', 'AREAVOL', 'GRM', 'P2VEG', 'DWM', 'INV', 'REGEN', 'CRWN')
measCur - the most current measurement of each plot in database
measEndyr - the most current measuremtn of each plot in database in or prior to measEndyr
Endyr.filter - a filter for bnd that specifies the boundary where measEndyr should be applied

Value

spxy	sf. If returnxy=TRUE, spatial xy point data.
pltids	data frame. A table of pltids that are within bnd.
spxy	sf data frame. If returnxy, a simple feature with pltids within bnd.
bndx	sf object. Input bnd.
xy.uniqueid	String. Unique identifier of plots in xy.
states	String. Vector of states that intersect bnd.
countyfips	String. Vector of countyfips values that intersect bnd.
stbnd.att	String. Name of state attribute used to select plots.

If savedata=TRUE and returnxy=TRUE, the plt data frame, including XY coordinates is saved to outfolder (xyplt).
If savedata=TRUE and returnxy=FALSE, the plt data frame, without XY coordinates is saved to

outfolder (pltids).
If savedata=TRUE and returnxy=TRUE and exportsp=TRUE, the spxy sf object is exported as shapefile to outfolder.

Note

If savebnd=TRUE:
If out_fmt=c('csv','shp'), the st_write (sf) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

If datsource="datmart", (default), data are imported from FIA DataMart. The plot coordinates have been altered for privacy (See https://www.fia.fs.fed.us/tools-data/spatial/Policy/index.php for details). The zip files are extracted on-the-fly from the online website. Web server connections will affect download speeds.

---

spImportSpatial *Spatial - Imports a spatial vector layer to an S4 Spatial object.*

Description

Imports a spatial vector layer to an S4 Spatial object.

Usage

```
spImportSpatial(
  layer = NULL,
  dsn = NULL,
```

```
  sql = NULL,
  polyfix = FALSE,
  gui = FALSE
)
```

Arguments

layer	Data frame object or String. Name of spatial layer. Can be layer with dsn, full pathname, including extension, or file name (with extension) in xy_dsn folder.
dsn	String. Name of database where layer is. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html).
sql	String. A sql syntax query to subset spatial layer.
polyfix	Logical. If polyfix=TRUE, uses buffer with 0 width to clean up polygons.
gui	Logical. If TRUE, search for layer within dsn.

Value

A spatial object

Note

Wrapper for sf package... st_read function.

Author(s)

Tracey S. Frescino

Examples

```
# Import data from `FIESTA`, save as object in environment
WYbh <- spImportSpatial(system.file("extdata",
                                    "sp_data/WYbighorn_adminbnd.shp",
                                    package = "FIESTA"))
```

---

spMakeSpatialPoints *Spatial - Generates an S4 SpatialPoints object from X/Y coordinates.*

Description

Generates an S4 SpatialPoints object with defined projection from a data table or matrix including X and Y coordinates, with option to export as an ArcGIS shapefile (*.shp).

Usage

```
spMakeSpatialPoints(
  xyplt,
  xyplt_dsn = NULL,
  xy.uniqueid = NULL,
  xvar = NULL,
  yvar = NULL,
  xy.crs = 4269,
  addxy = FALSE,
  exportsp = FALSE,
  savedata_opts = NULL
)
```

Arguments

xyplt	Data frame object or String. Name of layer with xy coordinates and unique identifier. Can be layer with xy_dsn, full pathname, including extension, or file name (with extension) in xy_dsn folder.
xyplt_dsn	String. Name of database or folder were xyplt is. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html).
xy.uniqueid	String. Unique identifier of xyplt rows.
xvar	String. Name of variable in xyplt defining x coordinate.
yvar	String. Name of variable in xyplt defining y coordinate.
xy.crs	PROJ.4 String or CRS object or Integer EPSG code defining Coordinate Reference System. (e.g., EPSG:4269-Geodetic coordinate system for North America, NAD83).
addxy	Logical. If TRUE, adds x and y variables to spatial sf object.
exportsp	Logical. If TRUE, exports spatial object.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when exportsp = TRUE.

Value

spplt	sf obect with spatial points and defined CRS.

If exportsp = TRUE, the sf object is written to specified output.

Note

If exportsp=TRUE and a shp output format is specified:
The ESRI shapefile driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). Name changes are output to the outfolder, 'outshpnm'_newnames.csv. The returned Spatial object will have original names, before truncating.

If Spatial object has more than 1 record, it cannot be exported.

Tracey S. Frescino

Examples

```
# Generate an `sf` points object with `spMakeSpatialPoints` for Wyoming plot
# data, stored in `FIESTA`
spMakeSpatialPoints(xyplt = WYplt,
                    xy.uniqueid = "CN",
                    xvar = "LON_PUBLIC",
                    yvar = "LAT_PUBLIC",
                    xy.crs = 4269)
```

---

spPoly2Rast *Spatial - Converts SpatialPolygons layer to raster.*

Description

Converts SpatialPolygons layer to raster.

Usage

```
spPoly2Rast(
  polyv,
  polyv_dsn = NULL,
  polyv.att,
  polyv.lut = NULL,
  rastfn.template = NULL,
  validate = FALSE,
  NODATA = NULL,
  outfolder = NULL,
  outfn = "polyrast",
  outext = "img",
  outfn.pre = NULL,
  outfn.date = FALSE,
  overwrite = FALSE
)
```

Arguments

polyv	sf R object or String. Polygon data to convert to raster. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
polyv_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of layer to convert. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if polyv is sf object.
polyv.att	String. Name of attribute in polyv to rasterize.

polyv.lut	Data frame. Lookup table of codes, if polyv.att is character or want to group codes. The lookup table must be data.frame including polyv.att and another column with classes.
rastfn.template	String. Full path name of raster to use as template for new raster.
validate	Logical. If TRUE, validates polyv and clippolyv before clipping. Uses sf::st_make_valid with default parameters (geos_method='valid_structure', geos_keep_collapsed=FALSE).
NODATA	Number. The NODATA value for background values. If NODATA is NULL, and a NODATA value is defined on the rastfn.template raster, the default is the defined NODATA value, else it is defined based on its datatype (see DEFAULT_NODATA for default data values).
outfolder	String. If exportshp=TRUE, name of output folder. If NULL, the working directory is used.
outfn	String. Name of output raster. If NULL, default is 'polyrast'.
outext	String. Name of raster extension (fmt).
outfn.pre	String. Add a prefix to output name (e.g., "01").
outfn.date	Logical. If TRUE, add date to end of outfile (e.g., outfn_'date'.csv).
overwrite	Logical. If TRUE and exportshp=TRUE, overwrite files in outfolder.

Value

A list containing raster and raster information derived from the original polygon.

Note

On-the-fly projection conversion
The spTransform (sf) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

If exportshp=TRUE:
The st_write (sf) function is called. The ArcGIS driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If Spatial object has more than 1 record, it will be returned but not exported.

Author(s)

Tracey S. Frescino

Examples

```
# Get polygon vector layer from FIESTA external data
WYbhdistfn <- system.file("extdata",
```

```
                          "sp_data/WYbighorn_districtbnd.shp",
                          package = "FIESTA")

# Turn polygon into raster
# Note: raster values must be numeric, therefore names were changed to
# numeric codes based on lookup table produced from the following code.
new_rast <- spPoly2Rast(polyv = WYbhdistfn,
                        polyv.att = "DISTRICTNA",
                        outfolder = tempdir())
```

---

spReprojectRaster *Spatial - Reprojects an Esri shapefile (*shp) or S4 Spatial object.*

Description

Reprojects an Esri shapefile (*.shp) or S4 Spatial object to a new geographic or projected coordinate system, with option to save new object.

Usage

```
spReprojectRaster(
  rastfn,
  bands = NULL,
  crs = NULL,
  rast.ref = NULL,
  crs.new = NULL,
  res.new = NULL,
  bbox.new = NULL,
  dtype.new = NULL,
  NODATA.new = NULL,
  resamp.method = "near",
  crs.default = "EPSG:5070",
  compress = NULL,
  BigTIFF = FALSE,
  outfolder = NULL,
  outfn = NULL,
  outext = NULL,
  overwrite = FALSE
)
```

Arguments

rastfn	String or Raster. File name(s) with extensions, or raster object(s). Note: raster objects must be written to file.
bands	Numeric vector. If rast is a multi-layer raster and only 1 or some layers are desired, specify layer number(s) in a vector format. If NULL, all layers are projected.

crs	Coordinate Reference System (CRS). The CRS of rastfn if not defined. EPSG:code, PROJ.4 declaration, or .prj file containing WKT. For example, PROJ.4: "+proj=moll +lon_0=0 +x_0=0 +y_0=0 +ellps=WGS84 +datum=WGS84 +units=m +no_defs". If NULL, and the CRS of rastfn is not defined, uses crs.default.
rast.ref	String or Raster. File name(s) with extensions, or raster object to use as reference raster.
crs.new	Coordinate Reference System. New CRS for rastfn. EPSG:code, PROJ.4 declaration, or .prj file containing WKT. For example, PROJ.4: "+proj=moll +lon_0=0 +x_0=0 +y_0=0 +ellps=WGS84 +datum=WGS84 +units=m +no_defs".
res.new	Integer vector. One or two values defining new resolution of raster (in target georeferenced units) (e.g., 30 or c(30,30)).
bbox.new	<xmin ymin xmax ymax> Georeferenced extent or bounding box of new raster.
dtype.new	String. Force a data type of new raster. If NULL, the data type will be same as rastfn (e.g., Byte, Int16, UInt16).
NODATA.new	Integer. Set nodata values for new raster. New files will be initialized to this value and if possible the nodata value will be recorded in the output file. Use a value of "None" to ensure that nodata is not defined. If NULL, NODATA and rastfn has a set NODATA value, this value will be used for new raster.
resamp.method	Method for resampling ('near', 'bilinear', 'cubic', 'cubicspline', 'landzos', 'average', 'mode', 'min', 'max', 'med', 'q1', 'q3').
crs.default	Coordinate Reference System. A default CRS if crs.new=NULL. The default is: EPSG:5070, Conus Albers, PRJ4='+proj=aea +lat_1=29.5 +lat_2=45.5 +lat_0=23 +lon_0=-96, +x_0=0 +y_0=0", "+ellps=GRS80 +towgs84=0,0,0,-0,-0,-0,0 +units=m +no_defs'.
compress	String. An optional compression type ('LZW', "DEFLATE', "PACKBITS').
BigTIFF	Logical. If TRUE, compress option for big files (> 4GB).
outfolder	String. If exportsp=TRUE, name of output folder. If NULL, the working directory is used.
outfn	String. Name of output raster. If NULL, default is 'polyrast'.
outext	String. Name of raster extension (fmt). If NULL, uses extension from outfn or rastfn.
overwrite	Logical. If TRUE, overwrites raster file.

Value

rastfn.new	String. Full path name to reprojected raster.

Note

Coordinate Reference Systems (CRS)
An ellipse is an estimated model describing the basic shape of the Earth and is the basis for all coordinate systems. There are many ellipsoids designed for local (e.g., NAD27) or global (e.g., WGS84, GRS80) use. The datum defines the reference position of the coordinate axes associated with a specific ellipsoid. Specifying the datum also defines the ellipsoid, whereas specifying the ellipsoid does not provide information of the datum.

WGS84 vs NAD83 WGS84 and NAD83 datums are often used interchangeably, and use very similar ellipsoids (WGS84 and GRS80, respectively), but have different reference points. Slight tectonic shifts through time have caused increased divergence between the two, with NAD83 datum intended to track movements more consistently.

Common Datums and associated spheroid (ellipsoid):
NAD27 - North American Datum of 1927 (Clarke 1866 spheroid)
NAD83 - North American Datum of 1983 (GRS 1980 spheroid)
WGS84 - World Geodetic System of 1984 (WGS 1984 spheroid)

From R, use projInfo for list of different projections and datums.
> projInfo(type="proj")
> projInfo(type="datum")

Common EPSG Geodetic codes in U.S.
EPSG:4326 - Longitude/Latitude (WGS84) - Common for global displays (used by Google Earth)
EPSG:4269 - Longitude/Latitude (NAD83) - Common by U.S. Federal Agencies

The sf::st_transform (GDAL) method is used for map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

Examples

```
# Get raster layers from FIESTA external data
demfn <- system.file("extdata",
                     "sp_data/WYbighorn_dem_250m.img",
                     package = "FIESTA")

# Check original projection
sf::st_crs(terra::rast(demfn))$proj4string

# Reproject raster
reprojected <- spReprojectRaster(rastfn = demfn,
                                 crs.new = "EPSG:32613",
                                 outfolder = tempdir())

# Check new projection
sf::st_crs(terra::rast(demfn))$proj4string
```

spReprojectVector *Spatial - Reprojects an sf spatial object.*

Description

Reprojects an sf spatial object to a new coordinate reference system.

Usage

```
spReprojectVector(
  layer,
  dsn = NULL,
  crs.new,
  exportsp = FALSE,
  savedata_opts = NULL
)
```

Arguments

layer	sf class R object or String. The spatial layer must have a defined projection (test using sf::st_crs(layer)).
dsn	String. Data source name (dsn; i.e., folder or database name) of splayer. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if layer is an R object.
crs.new	EPSG Integer or PROJ.4 String. New EPSG Geodetic Parameter Dataset definition or gdal PROJ.4 string identifying the new coordinate system (e.g., "+proj=longlat +datum=NAD83 +no_defs +ellps=GRS80 +towgs84=0,0,0").
exportsp	Logical. If TRUE, the spatial reprojected object is exported to outfolder (see spExportSpatial for details).
savedata_opts	List. See help(savedata_options()) for a list of options for saving data. If out_layer = NULL, default = 'layerprj'.

Value

layerprj	sf object. Reprojected spatial layer.

If exportsp = TRUE, a spatial layer is written to outfolder (See note).

Note

Coordinate Reference Systems (CRS)
An ellipse is an estimated model describing the basic shape of the Earth and is the basis for all coordinate systems. There are many ellipsoids designed for local (e.g., NAD27) or global (e.g., WGS84, GRS80) use. The datum defines the reference position of the coordinate axes associated with a specific ellipsoid. Specifying the datum also defines the ellipsoid, whereas specifying the ellipsoid does not provide information of the datum.

WGS84 vs NAD83 WGS84 and NAD83 datums are often used interchangeably, and use very similar ellipsoids (WGS84 and GRS80, respectively), but have different reference points. Slight tectonic shifts through time have caused increased divergence between the two, with NAD83 datum intended to track movements more consistently.

Common Datums and associated spheroid (ellipsoid):
NAD27 - North American Datum of 1927 (Clarke 1866 spheroid)
NAD83 - North American Datum of 1983 (GRS 1980 spheroid)
WGS84 - World Geodetic System of 1984 (WGS 1984 spheroid)

From R, use projInfo for list of different projections and datums.
> projInfo(type="proj")
> projInfo(type="datum")

Common EPSG Geodetic codes in U.S.
EPSG:4326 - Longitude/Latitude (WGS84) - Common for global displays (used by Google Earth)
EPSG:4269 - Longitude/Latitude (NAD83) - Common by U.S. Federal Agencies

The sf::st_transform (GDAL) method is used for map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

ESRI Shapefile Driver
If exportsp=TRUE:
The st_write (sf) function is called. If out_fmt="shp", the ESRI Shapefile driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If sf object has more than 1 record, it will be returned but not exported.

Examples

```
# Set up `SpatialPoints` object
WYspplt <- spMakeSpatialPoints(xyplt = WYplt,
                               xy.uniqueid = "CN",
                               xvar = "LON_PUBLIC",
                               yvar = "LAT_PUBLIC",
                               xy.crs = 4326)
# Check CRS
sf::st_crs(WYspplt)

# Set up projection
prj <- "+proj=utm +zone=12 +ellps=GRS80 +datum=NAD83 +units=m +no_defs"
```

```
# Use `spReprojectVector` to reproject the vector
WYspplt.utm12 <- spReprojectVector(layer = WYspplt,
                                   crs.new = prj)
# Check results
sf::st_crs(WYspplt.utm12)
```

---

spUnionPoly *Spatial - Generate a unioned sf object with polygons and attributes from two sf polygon objects.*

Description

Generate a unioned sf object with polygons and attributes from two sf polygon objects.

Usage

```
spUnionPoly(
  polyv1,
  polyv1_dsn = NULL,
  polyv2,
  polyv2_dsn = NULL,
  validate = FALSE,
  showext = FALSE,
  areacalc = FALSE,
  areavar = "ACRES_GIS",
  exportsp = FALSE,
  savedata_opts = NULL,
  ...
)
```

Arguments

polyv1	sf R object or String. Polygon data to union. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
polyv1_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of layer to union. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if polyv1 is sf object.
polyv2	sf R object or String. Polygon data to union. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
polyv2_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of layer to union. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if polyv2 is sf object.
validate	Logical. If TRUE, validates polyv and clippolyv before clipping. Uses sf::st_make_valid with default parameters (geos_method='valid_structure', geos_keep_collapsed=FALSE).

showext	Logical. If TRUE, layer extents are displayed in plot window.
areacalc	Logical. If TRUE, calculate area of unioned polygons and append to attribute table (See details).
areavar	String. Name of area variable.
exportsp	Logical. If TRUE, the spatial unioned object is exported to outfolder (see spExportSpatial for details).
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when export = TRUE. If out_layer = NULL, default = 'polyunion'.
...	For extendibility.

Details

*If variable = NULL, then it will prompt user for input.

Uses raster function union to merge two polygons and crop, if clip=TRUE. Generates a new ID for each polygon and appends attributes from both polygons.

areacalc
If areacalc = TRUE and the unioned spatial object is not in a projected coordinate system (i.e., longlat), the object will be reprojected to the Albers Equal Area projection before area is calculated.

Value

sf object of unioned polygon. If polyv1 and polyv2 have different projections, the projection of returned object will have the same projection as poly1 (See note about on-the-fly projection conversion).

If exportsp=TRUE, the sf object will be written to outfolder (See note).

Note

On-the-fly projection conversion
The spTransform (sf) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

ESRI Shapefile Driver
If exportsp=TRUE:
The st_write (sf) function is called. If out_fmt="shp", the ESRI Shapefile driver truncates variable names to 10 characters or less. Variable names are changed before export using an internal function (trunc10shp). If sf object has more than 1 record, it will be returned but not exported.

Examples

```
## Not run:
# Set up data from `FIESTA` and `raster`
WYbhfn <- system.file("extdata",
                      "sp_data/WYbighorn_adminbnd.shp",
                      package = "FIESTA")
WYbh <- spImportSpatial(WYbhfn)

# Load in USAco data from geodata package
USAco <- geodata::gadm(country="United States", level=2, path=tempdir())

# Generate unioned `sf` object
polyUnion <- spUnionPoly(polyv1 = USAco[USAco$NAME_1 == "Wyoming",],
                         polyv2 = WYbh,
                         areacalc = TRUE)

# Plot the result
plot(sf::st_geometry(polyUnion))

## End(Not run)
```

---

spZonalRast — *Spatial - Extracts summary statistics by polygon (i.e., zone) for a raster.*

Description

Extracts summary statistics by polygon, or zone for a raster (single or multi-band).

Usage

```
spZonalRast(
  polyv,
  polyv_dsn = NULL,
  polyv.att = NULL,
  rastfn,
  rastfolder = NULL,
  bands = NULL,
  zonalstat,
  pixelfun = NULL,
  validate = FALSE,
  outname = NULL,
  showext = FALSE,
  rastlut = NULL,
  rast.NODATA = NULL,
  savedata = FALSE,
  savedata_opts = NULL
)
```

Arguments

polyv	sf R object or String. Polygon data to identify zones. Can be a spatial polygon object, full pathname to a shapefile, or name of a layer within a database.
polyv_dsn	String. Data source name (dsn; e.g., sqlite or shapefile pathname) of zonal layer. The dsn varies by driver. See gdal OGR vector formats (https://www.gdal.org/ogr_formats.html). Optional if polyv is sf object.
polyv.att	String. Name of attribute in polyv to identify zones for summarizing raster statistics.
rastfn	String or Raster. File name with extension, or raster object. Note: raster objects must be written to file.
rastfolder	String. Name of the folder with raster layers. Optional. Useful if all raster layers are in same folder.
bands	Numeric vector. If rast is a multi-layer raster and only 1 or some layers are desired, specify layer number(s) in a vector format. If NULL, all layers are summed.
zonalstat	String vector. Zonal statistic(s) to return for rasters with continuous data ("mean", "sum", "majority", "minority", "variety", "npixels") or rasters with discrete data ("count", "proportion").
pixelfun	Function. A function to apply to the individual pixel values before calculating sum and mean. The function should accept a single numeric argument (pixel value) and return a single numeric argument.
validate	Logical. If TRUE, validates polyv and clippolyv before clipping. Uses sf::st_make_valid with default parameters (geos_method='valid_structure', geos_keep_collapsed=FALSE).
outname	String. Variable name for output. The output names will use outname as a prefix to summary statistics (i.e., 'outname'.mean, 'outname'.sum).
showext	Logical. If TRUE, layer extents are displayed in plot window.
rastlut	Data frame. A look up table to recode raster values. Must be 2 columns: Column 1 with raster values and column 2 with recode values.
rast.NODATA	Numeric. NODATA value (if not already defined) or other values to ignore. These values will be removed from output zonal table. NODATA values defined in raster are removed before zonal statistic calculations.
savedata	Logical. If TRUE, the zonal data are saved to outfolder.
savedata_opts	List. See help(savedata_options()) for a list of options. Only used when savedata = TRUE. If out_layer = NULL, default = 'zonalext'.

Details

Use spZonalRast() to prompt for input.

If the projection of polyv is different than the projection of rast, the polyv SpatialPolygons object is converted to the projection of rast (See note about on-the-fly projection conversion).

Value

zonalext	Data frame. Zonal statistics by polygon attribute (attribute).
outname	String vector. Names of zonal statistic variables generated in zonalext data frame.
rasterfile	String vector. Names of raster file(s) associated with zonal statistic.

If savedata=TRUE, outdat data frame is saved to outfolder (Default name: zonalext_'date'.csv).

Note

rast.NODATA
NODATA values are raster pixel values that have no data of interest, including pixels within the extent of the layer, but outside the area of interest. Sometimes these pixels have been defined previously. The defined NODATA pixels are imported to R as NULL values. When not previously defined, the pixels outside the area of interest will be the minimum or maximum value depending on the data type (e.g., 16-bit signed: min=-32,768; max=32,768) or byte size (1 byte: min=0; max=255). These NODATA values will be added to the zonal statistic calculations if not specified in rast.NODATA.

On-the-fly projection conversion
The spTransform (sf) method is used for on-the-fly map projection conversion and datum transformation using PROJ.4 arguments. Datum transformation only occurs if the +datum tag is present in the both the from and to PROJ.4 strings. The +towgs84 tag is used when no datum transformation is needed. PROJ.4 transformations assume NAD83 and WGS84 are identical unless other transformation parameters are specified. Be aware, providing inaccurate or incomplete CRS information may lead to erroneous data shifts when reprojecting. See spTransform help documentation for more details.

WYplt *FIA data. Plot-level data from FIA public database.*

Description

FIA plot-level data for the state of Wyoming, FIA Evaluation 561301, including inventory years 2011-2013.

Format

A data frame with 20 columns and 3047 rows.

Details

VARIABLE	DESCRIPTION
CN	Unique FIADB identifier
PREV_PLT_CN	Previous unique FIADB identifier
INVYR	Inventory year
STATECD	State code (FIPS)
CYCLE	Inventory cycle number
SUBCYCLE	Inventory subcycle number (Do not use subcycle 99 for estimation)
UNITCD	Survey unit code
COUNTYCD	County code
PLOT	Phase 2 plot number (Public)
LON_PUBLIC	Longitude - fuzzed/swapped (Decimal degrees; NAD83)
LAT_PUBLIC	Latitude - fuzzed/swapped (Decimal degrees; NAD83)
PLOT_NONSAMPLE_REASN_CD	Plot nonsampled reason
SAMP_METHOD_CD	Sample method code
SUBP_EXAMINE_CD	Subplots examined code
MANUAL	Manual version number
INTENSITY	Intensity
MEASYEAR	Measurement year
MEASMON	Measurement month
MEASDAY	Measurement day
REMPER	Remeasurement period
DESIGNCD	Plot design
P2PANEL	Phase 2 panel number
SUBPANEL	Subpanel number
ELEV	Elevation (ft)
KINDCD	Sample kind
MORT_TYP_CD	Type of annual mortality volume (1:Current annual; 2:Periodic annual)
GROW_TYP_CD	Type of annual volume growth (1:Current annual; 2:Periodic annual)
NF_PLOT_NONSAMPLE_REASN_CD	Nonforest sampling status
P2VEG_SAMPLING_STATUS_CD	P2 vegetation sampling status
PLOT_STATUS_CD	Plot sampling status
NF_PLOT_STATUS_CD	Nonforest plot sampling status
NBRCND	DERIVED: Number of conditions for plot

NBRCNDFOR	DERIVED: Number of different forest type conditions for plot
FORNONSAMP	DERIVED: Plot status - sampled and nonsampled (Combination of PLOT_NO
CCLIVEPLT	DERIVED: Percent cover of live trees for plot (LIVE_CANOPY_CVR_PCT *
UNIQUEID	DERIVED: Unique identifier for plot location ('Z'+STATECD(2)+UNITCD(2

`WYpltassgn` *FIA data. Plot assignment data from FIA public database.*

Description

FIA plot-level stratification assignments for the state of Wyoming, FIA Evaluation 561301, including inventory years 2011-2013.

Format

A dataframe with 24 columns and 3047 rows.

Source

FIA national database (FIADB_1.7.0.00), downloaded September 18, 2016.

References

WYseed — *FIA data. Seedling data from FIA public database.*

Description

FIA seedling data for the state of Wyoming, FIA Evaluation 561301, including inventory years 2011-2013.

Format

A dataframe with 10 columns and 1607 rows.

Source

FIA national database (FIADB_1.7.0.00), downloaded September 18, 2016.

References

WYstratalut — *FIA data. Post-stratification data from FIA public database.*

Description

FIA stratification data for the state of Wyoming, FIA Evaluation 561301, including inventory years 2011-2013.

Format

A dataframe with 7 columns and 35 rows.

Source

FIA national database (FIADB_1.7.0.00), downloaded September 18, 2016.

References

WYsubplot — *FIA data. Subplot data from FIA public database.*

Description

FIA subplot-level data for the state of Wyoming, FIA Evaluation 561301, including inventory years 2011-2013.

Format

A dataframe with 9 columns and 20596 rows.

Source

FIA national database (FIADB_1.7.0.00), downloaded September 18, 2016.

References

WYsubp_cond — *FIA data. Subplot condition data from FIA public database.*

Description

FIA subplot condition-level data for the state of Wyoming, FIA Evaluation 561301, including inventory years 2011-2013.

Format

A dataframe with 6 columns and 20641 rows.

Source

FIA national database (FIADB_1.7.0.00), downloaded September 18, 2016.

References

WYtree — *FIA data. Tree-level data from FIA public database.*

Description

FIA tree-level data for the state of Wyoming, FIA Evaluation 561301, including inventory years 2011-2013.

Format

A dataframe with 19 columns and 18380 rows.

Source

FIA national database (FIADB_1.7.0.00), downloaded September 18, 2016.

References

WYunitarea — *FIA data. Acres data from FIA public database.*

Description

FIA acres by estimation unit for the state of Wyoming, FIA Evaluation 561301, including inventory years 2011-2013.

Format

A data table with 5 columns and 23 rows.

Source

FIA national database (FIADB_1.7.0.00), downloaded September 18, 2016.

WYunitzonal *Zonal data. Zonal means for auxiliary data in counties in Wyoming.*

Description

Zonal means and pixel counts for certain auxiliary data in counties in Wyoming. Includes county code variable to distinguish counties, and state code variable to distinguish states.

Format

A dataframe with 9 columns and 23 rows.
