Package 'Lahman'

May 4, 2023

Type Package

Title Sean 'Lahman' Baseball Database

Version 11.0-0

Date 2023-04-16

Author Michael Friendly [aut],
Chris Dalzell [cre, aut],
Martin Monkman [aut],
Dennis Murphy [aut],
Vanessa Foot [ctb],
Justeena Zaki-Azat [ctb],
Sean Lahman [cph]

Maintainer Chris Dalzell <cdalzell@gmail.com>

Description Provides the tables from the 'Sean Lahman Baseball Database' as a set of R data.frames. It uses the data on pitching, hitting and fielding performance and other tables from 1871 through 2022, as recorded in the 2023 version of the database. Documentation examples show how many baseball questions can be investigated.

Language en-US

Depends R (>= 3.5.0)

Suggests lattice, ggplot2, googleVis, data.table, vcd, reshape2, tidyr, knitr, rmarkdown, car

Imports dplyr

R topics documented:

Lahman-package *Sean Lahman's Baseball Database*

Description

This database contains pitching, hitting, and fielding statistics for Major League Baseball from 1871 through 2021. It includes data from the two current leagues (American and National), the four other "major" leagues (American Association, Union Association, Players League, and Federal League), and the National Association of 1871-1875.

This database was created by Sean Lahman, who pioneered the effort to make baseball statistics freely available to the general public. What started as a one man effort in 1994 has grown tremendously, and now a team of researchers have collected their efforts to make this the largest and most accurate source for baseball statistics available anywhere.

This database, in the form of an R package offers a variety of interesting challenges and opportunities for data processing and visualization in R.

In the current version, the examples make extensive use of the `dplyr` package for data manipulation (tabulation, queries, summaries, merging, etc.), reflecting the original relational database design and `ggplot2` for graphics.

Details

Package:	Lahman
Type:	Package
Version:	11.0-0
Date:	2023-04-16
License:	GPL version 2 or newer
LazyLoad:	yes
LazyData:	yes

The main form of this database is a relational database in Microsoft Access format. The design follows these general principles: Each player is assigned a unique code (`playerID`). All of the information in different tables relating to that player is tagged with his `playerID`. The `playerID`s are linked to names and birthdates in the `People` table. Similar links exist among other tables via analogous `*ID` variables.

The database is composed of the following main tables:

`People` Player names, dates of birth, death and other biographical info

`Batting` batting statistics

`Pitching` pitching statistics

`Fielding` fielding statistics

A collection of other tables is also provided:

Teams:

Teams	yearly stats and standings
TeamsHalf	split season data for teams
TeamsFranchises	franchise information

Post-season play:

BattingPost	post-season batting statistics
PitchingPost	post-season pitching statistics
FieldingPost	post-season fielding data
SeriesPost	post-season series information

Awards:

AwardsManagers	awards won by managers
AwardsPlayers	awards won by players
AwardsShareManagers	award voting for manager awards
AwardsSharePlayers	award voting for player awards

Hall of Fame: links to People via `hofID`

HallOfFame	Hall of Fame voting data

Other tables:

AllstarFull - All-Star games appearances; Managers - managerial statistics; FieldingOF - outfield position data; ManagersHalf - split season data for managers; Salaries - player salary data; Appearances - data on player appearances; Schools - Information on schools players attended; CollegePlaying - Information on schools players attended, by player and year;

Variable label tables are provided for some of the tables:

battingLabels, pitchingLabels, fieldingLabels

Source

Lahman, S. (2023) Lahman's Baseball Database, 1871-2022, Main page, https://www.seanlahman.com/baseball-archive/statistics/

AllstarFull *AllstarFull table*

Description

All Star appearances by players

Usage

```
data(AllstarFull)
```

Format

A data frame with 5516 observations on the following 8 variables.

`playerID` Player ID code

`yearID` Year

`gameNum` Game number (for years in which more than one game was played)

`gameID` Game ID code

`teamID` Team; a factor

`lgID` League; a factor with levels `AL` `NL`

`GP` Game played (zero if player did not appear in game)

`startingPos` If the player started, what position he played

Source

Lahman, S. (2023) Lahman's Baseball Database, 1871-2022, 2022 version, https://www.seanlahman.com/baseball-archive/statistics/

Examples

```
data(AllstarFull)

# find number of appearances by players in the All Star games
player_appearances <- with(AllstarFull, rev(sort(table(playerID))))

# How many All-Star players, in total?
length(player_appearances)

# density plot of the whole distribution
plot(density(player_appearances), main="Player appearances in All Star Games")
rug(jitter(player_appearances))

# who has played in more than 10 ASGs?
player_appearances[player_appearances > 10]
hist(player_appearances[player_appearances > 10])
```

```
# Hank Aaron's All-Star record:
subset(AllstarFull, playerID == "aaronha01")

# Years that Stan Musial played in the ASG:
with(AllstarFull, yearID[playerID == "musiast01"])

# Starting positions he played (NA means did not start)
with(AllstarFull, startingPos[playerID == "musiast01"])

# All-Star rosters from the 1966 ASG
subset(AllstarFull, gameID == "NLS196607120")

# All-Stars from the Washington Nationals
subset(AllstarFull, teamID == "WAS")

# Teams with the fewest All-Stars
rare <- names(which(table(AllstarFull$teamID) < 10))

# Records associated with the 'rare' teams:
# (There are a few teamID typos: can you spot them?)
subset(AllstarFull, teamID %in% rare)
```

`Appearances` *Appearances table*

Description

Data on player appearances

Usage

```
data(Appearances)
```

Format

A data frame with 112106 observations on the following 21 variables.

`yearID` Year

`teamID` Team; a factor

`lgID` League; a factor with levels `AA` `AL` `FL` `NL` `PL` `UA`

`playerID` Player ID code

`G_all` Total games played

`GS` Games started

`G_batting` Games in which player batted

`G_defense` Games in which player appeared on defense

`G_p` Games as pitcher

`G_c` Games as catcher

`G_1b` Games as firstbaseman

`G_2b` Games as secondbaseman

`G_3b` Games as thirdbaseman

`G_ss` Games as shortstop

`G_lf` Games as leftfielder

`G_cf` Games as centerfielder

`G_rf` Games as right fielder

`G_of` Games as outfielder

`G_dh` Games as designated hitter

`G_ph` Games as pinch hitter

`G_pr` Games as pinch runner

Details

The Appearances table in the original version has some incorrect variable names. In particular, the 5th column is `career_year`.

  rename(C = G_c, `1B` = G_1b, `2B` = G_2b, SS = G_ss,
         `3B` = G_3b, LF = G_lf, CF = G_cf, RF = G_rf) %>%
  gather(pos, G, C:RF) %>%
  group_by(pos, playerID) %>%
  summarise(G = sum(G)) %>%
  arrange(desc(G)) %>%
  do(head(., 1))
```

AwardsManagers *AwardsManagers table*

Description

Award information for managers awards

Usage

```
data(AwardsManagers)
```

Format

A data frame with 179 observations on the following 6 variables.

`playerID` Manager (player) ID code

`awardID` Name of award won

`yearID` Year

`lgID` League; a factor with levels `AL` `NL`

`tie` Award was a tie (Y or N)

`notes` Notes about the award

Source

Lahman, S. (2023) Lahman's Baseball Database, 1871-2022, 2022 version, https://www.seanlahman.com/baseball-archive/statistics/

Examples

```
# Post-season managerial awards

# Number of recipients of each award by year
with(AwardsManagers, table(yearID, awardID))

# 1996 award winners
subset(AwardsManagers, yearID == 1996)

# AL winners of the BBWAA managerial award
subset(AwardsManagers, awardID == "BBWAA Manager of the year" &
                         lgID == "AL")

# Tony LaRussa's manager of the year awards
subset(AwardsManagers, playerID == "larusto01")
```

AwardsPlayers *AwardsPlayers table*

Description

Award information for players awards

Usage

```
data(AwardsPlayers)
```

Format

A data frame with 6879 observations on the following 6 variables.

`playerID` Player ID code

`awardID` Name of award won

`yearID` Year

`lgID` League; a factor with levels `AA` `AL` `ML` `NL`

`tie` Award was a tie (Y or N)

`notes` Notes about the award

Source

Lahman, S. (2023) Lahman's Baseball Database, 1871-2022, 2022 version, https://www.seanlahman.com/baseball-archive/statistics/

Examples

```
data(AwardsPlayers)
# Which awards have been given and how many?
with(AwardsPlayers, table(awardID))
awardtab <- with(AwardsPlayers, table(awardID))

# Plot the awardtab table as a Cleveland dot plot
library("lattice")
dotplot(awardtab)

# Restrict to MVP awards
mvp <- subset(AwardsPlayers, awardID == "Most Valuable Player")
# Who won in 1994?
mvp[mvp$yearID == 1994L, ]

goldglove <- subset(AwardsPlayers, awardID == "Gold Glove")
# which players won most often?
GGcount <- table(goldglove$playerID)
GGcount[GGcount>10]
```

```
# Triple Crown winners
subset(AwardsPlayers, awardID == "Triple Crown")

# Simultaneous Triple Crown and MVP winners
# (compare merged file to TC)
TC <- subset(AwardsPlayers, awardID == "Triple Crown")

keepvars <- c("playerID", "yearID", "lgID.x")
merge(TC, MVP, by = c("playerID", "yearID"))[ ,keepvars]
```

`AwardsShareManagers` *AwardsShareManagers table*

Description

Award voting for managers awards

Usage

```
data(AwardsShareManagers)
```

Format

A data frame with 425 observations on the following 7 variables.

`awardID` name of award votes were received for

`yearID` Year

`lgID` League; a factor with levels `AL` `NL`

`playerID` Manager (player) ID code

`pointsWon` Number of points received

`pointsMax` Maximum number of points possible

`votesFirst` Number of first place votes

Source

Lahman, S. (2023) Lahman's Baseball Database, 1871-2022, 2022 version, https://www.seanlahman.com/baseball-archive/statistics/

Examples

```
# Voting for the BBWAA Manager of the Year award by year and league

require("dplyr")

# Sort in decreasing order of points by year and league
AwardsShareManagers %>%
   group_by(yearID, lgID) %>%
   arrange(desc(pointsWon))

# Any unanimous winners?
AwardsShareManagers %>%
  filter(pointsWon == pointsMax)

# Manager with highest proportion of possible points
AwardsShareManagers %>%
   mutate(propWon = pointsWon/pointsMax) %>%
   arrange(desc(propWon)) %>%
   head(., 1)

# Bobby Cox's MOY vote tallies
AwardsShareManagers %>%
  filter(playerID == "coxbo01")
```

`AwardsSharePlayers` *AwardsSharePlayers table*

Description

Award voting for managers awards

Usage

```
data(AwardsSharePlayers)
```

Format

A data frame with 6879 observations on the following 7 variables.

`awardID` name of award votes were received for

`yearID` Year

`lgID` League; a factor with levels `AL` `ML` `NL`

`playerID` Player ID code

`pointsWon` Number of points received

`pointsMax` Maximum number of points possible

`votesFirst` Number of first place votes

  summarise(n_top3 = n()) %>%
  arrange(desc(n_top3)) %>%
  filter(n_top3 > 6)
```

`Batting` *Batting table*

Description

Batting table - batting statistics

Usage

```
data(Batting)
```

Format

A data frame with 112184 observations on the following 22 variables.

`playerID` Player ID code

`yearID` Year

`stint` player's stint (order of appearances within a season)

`teamID` Team; a factor

`lgID` League; a factor with levels `AA` `AL` `FL` `NL` `PL` `UA`

`G` Games: number of games in which a player played

`AB` At Bats

`R` Runs

`H` Hits: times reached base because of a batted, fair ball without error by the defense

`X2B` Doubles: hits on which the batter reached second base safely

`X3B` Triples: hits on which the batter reached third base safely

`HR` Homeruns

`RBI` Runs Batted In

`SB` Stolen Bases

`CS` Caught Stealing

`BB` Base on Balls

`SO` Strikeouts

`IBB` Intentional walks

`HBP` Hit by pitch

`SH` Sacrifice hits

`SF` Sacrifice flies

`GIDP` Grounded into double plays

Details

Variables `X2B` and `X3B` are named `2B` and `3B` in the original database

Source

Lahman, S. (2023) Lahman's Baseball Database, 1871-2022, 2022 version, https://www.seanlahman.com/baseball-archive/statistics/

See Also

`battingStats` for calculating batting average (BA) and other derived statistics

`baseball` for a similar dataset, but a subset of players who played 15 or more seasons.

`Baseball` for data on batting in the 1987 season.

Examples

```
data(Batting)
head(Batting)
require("dplyr")

## Prelude: Extract information from Salaries and People
## to be merged with the batting data.

# Subset of Salaries data
salaries <- Salaries %>%
              select(playerID, yearID, teamID, salary)
```

```
# Subset of People table (player metadata)
peopleInfo <- People %>%
              select(playerID, birthYear, birthMonth, nameLast,
                     nameFirst, bats)

# Left join salaries and peopleInfo to batting data,
# create an age variable and sort by playerID, yearID and stint
# Returns an ignorable warning.
batting <- battingStats() %>%
             left_join(salaries,
                       by =c("playerID", "yearID", "teamID")) %>%
             left_join(peopleInfo, by = "playerID") %>%
             mutate(age = yearID - birthYear -
                           1L *(birthMonth >= 10)) %>%
             arrange(playerID, yearID, stint)

## Generate a ggplot similar to the NYT graph in the story about Ted
## Williams and the last .400 MLB season
# http://www.nytimes.com/interactive/2011/09/18/sports/baseball/WILLIAMS-GRAPHIC.html

# Restrict the pool of eligible players to the years after 1899 and
# players with a minimum of 450 plate appearances (this covers the

battingLabels *Variable Labels*

Description

These data frames provide descriptive labels for the variables in the Batting, Pitching and Fielding files (and related *Post files). They are useful for plots and other output using Label.

Usage

```
data(battingLabels)

data(fieldingLabels)

data(pitchingLabels)
```

Format

Each is data frame with observations on the following 2 variables.

`variable` variable name

`label` variable label

See Also

Label

Examples

```
data(battingLabels)
str(battingLabels)

require("dplyr")

# find and plot maximum number of homers per year
batHR <- Batting %>%
           filter(!is.na(HR)) %>%
           group_by(yearID) %>%
           summarise(max=max(HR))

with(batHR, {
  plot(yearID, max,
```

```

  abline(lm(max ~ yearID), col="red", lwd=2)
})
```

`BattingPost` *BattingPost table*

Description

Post season batting statistics

Usage

```
data(BattingPost)
```

Format

A data frame with 16374 observations on the following 22 variables.

`yearID` Year

`round` Level of playoffs

`playerID` Player ID code

`teamID` Team

`lgID` League; a factor with levels `AA` `AL` `NL`

`G` Games

`AB` At Bats

`R` Runs

`H` Hits

`X2B` Doubles

`X3B` Triples

`HR` Homeruns

`RBI` Runs Batted In

`SB` Stolen Bases

`CS` Caught stealing

`BB` Base on Balls

`SO` Strikeouts

`IBB` Intentional walks

`HBP` Hit by pitch

`SH` Sacrifices

`SF` Sacrifice flies

`GIDP` Grounded into double plays

Details

Variables X2B and X3B are named 2B and 3B in the original database

Source

Lahman, S. (2023) Lahman's Baseball Database, 1871-2022, 2022 version, https://www.seanlahman.com/baseball-archive/statistics/

Examples

```
# Post-season batting data
# Requires care since intra-league playoffs have evolved since 1969
# Simplest case: World Series

require("dplyr")

# Create a sub-data frame for modern World Series play
ws <- BattingPost %>%
        filter(round == "WS" & yearID >= 1903) %>%
        mutate(BA = 0 + (AB > 0) * round(H/AB, 3),
               TB = H + X2B + 2 * X3B + 3 * HR,
               SA = 0 + (AB > 0) * round(TB/AB, 3),
               PA = AB + BB + IBB + HBP + SH + SF,
               OB = H + BB + IBB + HBP,
               OBP = 0 + (AB > 0) * round(OB/PA, 3) )

# Players with most appearances in the WS:
ws %>% group_by(playerID) %>%
       summarise(appearances = n()) %>%
       arrange(desc(appearances)) %>%
       head(., 10)

# Non-Yankees with most WS appearances
ws %>% filter(teamID != "NYA") %>%
       group_by(playerID) %>%
       summarise(appearances = n()) %>%
       arrange(desc(appearances)) %>%
       head(., 10)

# Top ten single WS batting averages ( >= 10 AB )
ws %>% filter(AB > 10) %>%
       arrange(desc(BA)) %>%
       head(., 10)

# Top ten slugging averages in a single WS
ws %>% filter(AB > 10) %>%
  arrange(desc(SA)) %>%
  head(., 10)

# Hitting stats for the 1946 St. Louis Cardinals, ordered by BA
```

```
ws %>%
  filter(teamID == "SLN" & yearID == 1946) %>%
  arrange(desc(BA))

# Babe Ruth's WS profile
ws %>%
  filter(playerID == "ruthba01") %>%
  arrange(yearID)
```

`battingStats` *Calculate additional batting statistics*

Description

The `Batting` does not contain batting statistics derived from those present in the data.frame. This function calculates batting average (`BA`), plate appearances (`PA`), total bases (`TB`), slugging percentage (`SlugPct`), on-base percentage (`OBP`), on-base percentage + slugging (`OPS`), and batting average on balls in play (`BABIP`) for each record in a Batting-like data.frame.

Usage

```
battingStats(data = Lahman::Batting,
             idvars = c("playerID", "yearID", "stint", "teamID", "lgID"),
             cbind = TRUE)
```

Arguments

`data`	input data, typically `Batting`
`idvars`	ID variables to include in the output data.frame
`cbind`	If `TRUE`, the calculated statistics are appended to the input data as additional columns

Details

Standard calculations, e.g., `BA <- H/AB` are problematic because of the presence of `NA`s and zeros. This function tries to deal with those problems.

Value

A data.frame with all the observations in `data`. If `cbind==FALSE`, only the `idvars` and the calculated variables are returned.

Author(s)

Michael Friendly, Dennis Murphy

Examples

```
bstats <- battingStats()
str(bstats)
bstats <- battingStats(cbind=FALSE)
str(bstats)
```

CollegePlaying *CollegePlaying table*

Description

Information on schools players attended, by player

Usage

```
data(CollegePlaying)
```

Format

A data frame with 17350 observations on the following 3 variables.

`playerID` Player ID code

`schoolID` school ID code

`yearID` Year player attended school

Details

This data set reflects a change in the Lahman schema for the 2015 version. The old `SchoolsPlayers` table was replaced with this new table called `CollegePlaying`.

According to the documentation, this change reflects advances in the compilation of this data, largely led by Ted Turocy. The old table reported college attendance for major league players by listing a start date and end date. The new version has a separate record for each year that a player attended. This allows us to better account for players who attended multiple colleges or skipped a season, as well as to identify teammates.

Lahman, S. (2023) Lahman's Baseball Database, 1871-2022, 2022 version, https://www.seanlahman.com/baseball-archive/statistics/

Examples

```
data(CollegePlaying)
head(CollegePlaying)

## Q: What are the top universities for producing MLB players?
SPcount <- table(CollegePlaying$schoolID)
SPcount[SPcount>50]

library("lattice")
dotplot(SPcount[SPcount>50])
dotplot(sort(SPcount[SPcount>50]))

## Q: How many schools are represented in this dataset?
length(table(CollegePlaying$schoolID))

# Histogram of the number of players from each school who played in MLB:
with(CollegePlaying,
     hist(table(schoolID), xlab = "Number of players",
                           main = ""))
```

Fielding *Fielding table*

Description

Fielding table

Usage

```
data(Fielding)
```

Format

A data frame with 149365 observations on the following 18 variables.

`playerID` Player ID code

`yearID` Year

`stint` player's stint (order of appearances within a season)

`teamID` Team; a factor

`lgID` League; a factor with levels `AA` `AL` `FL` `NL` `PL` `UA`

`POS` Position

`G` Games

`GS` Games Started

`InnOuts` Time played in the field expressed as outs

`PO` Putouts

A Assists

E Errors

DP Double Plays

PB Passed Balls (by catchers)

WP Wild Pitches (by catchers)

SB Opponent Stolen Bases (by catchers)

CS Opponents Caught Stealing (by catchers)

ZR Zone Rating

```

`FieldingOF` *FieldingOF table*

Description

Outfield position data: information about positions played in the outfield

Usage

```
data(FieldingOF)
```

Format

A data frame with 12028 observations on the following 6 variables.

`playerID` Player ID code

`yearID` Year

`stint` player's stint (order of appearances within a season)

`Glf` Games played in left field

`Gcf` Games played in center field

`Grf` Games played in right field

Source

Lahman, S. (2023) Lahman's Baseball Database, 1871-2022, 2022 version, https://www.seanlahman.com/baseball-archive/statistics/

Examples

```
require("dplyr")
require("tidyr")

## Data set only goes through 1955
## Can get a more complete record from the Fielding data frame
## or from the Appearances data (see below)

## Output directly from the FieldingOF data

## Barry Bonds (no records: post-1955 player)
FieldingOF %>%
   filter(playerID == "bondsba01")

## Willie Mays (first few years)
FieldingOF %>%
  filter(playerID == "mayswi01")

## Ty Cobb (complete)
FieldingOF %>%
  filter(playerID == "cobbty01")

## One way to get OF game information from the Fielding data
## Note: OF games != sum(LF, CF, RF) because players can switch
## OF positions within a game. Players can also switch from
## other positions to outfield during a game. OF represents
## the number of games a player started in the outfield.
Fielding %>%
   select(playerID, yearID, stint, POS, G) %>%
   filter(POS %in% c("LF", "CF", "RF", "OF")) %>%
   tidyr::spread(POS, G, fill = 0) %>%
   filter(playerID == "trumbma01")

## Another way is through the Appearances data (no stint).
## Provides a somewhat nicer table than the above.

## Mark Trumbo (active player)
Appearances %>%
   select(playerID, yearID, G_lf, G_cf, G_rf, G_of) %>%
   filter(playerID == "trumbma01")

## A slightly better format, perhaps
Appearances %>%
  select(playerID, yearID, G_lf, G_cf, G_rf, G_of) %>%
  rename(LF = G_lf, CF = G_cf, RF = G_rf, OF = G_of) %>%
  filter(playerID == "trumbma01")

## Willie Mays (1951-1973)
Appearances %>%
  select(playerID, yearID, G_lf, G_cf, G_rf, G_of) %>%
  filter(playerID == "mayswi01")
```

```
## Joe DiMaggio (1936-1951)
Appearances %>%
  select(playerID, yearID, G_lf, G_cf, G_rf, G_of) %>%
  filter(playerID == "dimagjo01")
```

`FieldingOFsplit` *FieldingOFsplit table*

Description

Outfield position data: information about positions played in the outfield

Usage

```
data(FieldingOFsplit)
```

Format

A data frame with 35315 observations on the following 18 variables.

`playerID` Player ID code

`yearID` Year

`stint` player's stint (order of appearances within a season)

`teamID` Team; a factor

`lgID` League; a factor with levels `AA` `AL` `FL` `NL` `PL` `UA`

`POS` Position

`G` Games

`GS` Games Started

`InnOuts` Time played in the field expressed as outs

`PO` Putouts

`A` Assists

`E` Errors

`DP` Double Plays

`PB` Passed Balls (by catchers)

`WP` Wild Pitches (by catchers)

`SB` Opponent Stolen Bases (by catchers)

`CS` Opponents Caught Stealing (by catchers)

arrange(desc(TC)) %>%
do(head(., 1))    # provides top player by position
```

`HallOfFame` *Hall of Fame Voting Data*

Description

Hall of Fame table. This is composed of the voting results for all candidates nominated for the Baseball Hall of Fame.

Usage

```
data(HallOfFame)
```

Format

A data frame with 4323 observations on the following 9 variables.

`playerID` Player ID code

`yearID` Year of ballot

`votedBy` Method by which player was voted upon. See Details

`ballots` Total ballots cast in that year

`needed` Number of votes needed for selection in that year

`votes` Total votes received

`inducted` Whether player was inducted by that vote or not (Y or N)

`category` Category of candidate; a factor with levels `Manager` `Pioneer/Executive` `Player` `Umpire`

`needed_note` Explanation of qualifiers for special elections

Details

This table links to the `People` table via the `playerID`.

`votedBy`: Most Hall of Fame inductees have been elected by the Baseball Writers Association of America (`BBWAA`). Rules for election are described in https://en.wikipedia.org/wiki/National_Baseball_Hall_of_Fame_and_Museum#Selection_process.

# data frame of regression slopes, which represent average
# increase in percentage support by BBWAA members over a
```

```
# player's candidacy.
HOFslope <- HOFlt %>%
              group_by(playerID) %>%
              do(mod = lm(pct ~ yearID, data = .)) %>%
              do(data.frame(slope = coef(.$mod)[2]))

## Boxplots of regression slopes by induction group
ggplot(data.frame(HOFstatus, HOFslope),
       aes(x = elected, y = slope)) +
    geom_boxplot(width = 0.5) +
    geom_point(position = position_jitter(width = 0.2))

# Note 1: Only two players whose maximum voting percentage
# was over 60% were not eventually inducted
# into the HOF: Gil Hodges and Jack Morris.
# Red Ruffing was elected in a 1967 runoff election while
# the others have been voted in by the Veterans Committee.

# Note 2: Of the players whose slope was >= 2.5 among
# non-inductees, only Jack Morris has not (yet) been
# subsequently inducted into the HOF; however, his last year of
# eligibility was 2014 so he could be inducted by a future
# Veterans Committee.
```

`HomeGames` *HomeGames table*

Description

Data mapping teams to the stadiums they played regular season games in as the home team.

Usage

```
data(HomeGames)
```

Format

A data frame with 3200 observations on the following 9 variables.

`year.key` Year

`league.key` League; a factor with levels `AA` `AL` `FL` `NL` `PL` `UA`

`team.key` Team; a factor

`park.key` Unique identifier for each ballpark

`span.first` First date the park began acting as home field for the team

`span.last` Last date the park began acting as home field for the team

`games` Total games in this time span

`openings` Total opening in this time span

`attendance` Total attendance in this time span

Source

Lahman, S. (2023) Lahman's Baseball Database, 1871-2022, 2022 version, https://www.seanlahman.com/baseball-archive/statistics/

Examples

```
data(HomeGames)
library(dplyr)

# How many parks has every team played in as the home team for even a single game?
HomeGames %>%
  count(team.key) %>%
  arrange(team.key)

# What parks have the Toronto Blue Jays played in as the home team?
HomeGames %>%
  filter(team.key == "TOR") %>%
  arrange(span.last)

# What parks have the Boston Red Sox played in as the home team?
HomeGames %>%
  filter(team.key == "BOS") %>%
  arrange(span.last)

# What is the Toronto Blue Jays annual total home attendance by year?
HomeGames %>%
  filter(team.key == "TOR") %>%
  group_by(year.key) %>%
  summarize(total.attendance = sum(attendance)) %>%
  arrange(year.key)
```

Label *Extract the Label for a Variable*

Description

Extracts the label for a variable from one or more of the *Labels files. This is useful for plots and other displays because the variable names are often cryptically short.

Usage

```
Label(var, labels = rbind(Lahman::battingLabels,
                          Lahman::pitchingLabels,
                          Lahman::fieldingLabels))
```

Arguments

var	name of a variable
labels	label table(s) to search, a 2-column dataframe containing variable names and labels.

Value

Returns the variable label, or `var` if no label is found

Author(s)

Michael Friendly

See Also

`battingLabels`, `pitchingLabels`, `fieldingLabels`

Examples

```
require("dplyr")
# find and plot maximum number of homers per year
batHR <- Batting %>%
           filter(!is.na(HR)) %>%
           group_by(yearID) %>%
           summarise(max = max(HR))

with(batHR, {
  plot(yearID, max,
       xlab=Label("yearID"), ylab=paste("Maximum", Label("HR")),
       cex=0.8)
  lines(lowess(yearID, max), col="blue", lwd=2)
  abline(lm(max ~ yearID), col="red", lwd=2)
})
```

LahmanData *Lahman Datasets*

Description

This dataset gives a concise description of the data files in the Lahman package. It may be useful for computing on the various files.

Usage

```
data(LahmanData)
```

Format

A data frame with 24 observations on the following 5 variables.

`file` name of dataset

`class` class of dataset

`nobs` number of observations

`nvar` number of variables

`title` dataset title

Details

This dataset is generated using `vcdExtra::datasets(package="Lahman")` with some post-processing.

Examples

```
data(LahmanData)

# find ID variables in the datasets
IDvars <- lapply(LahmanData[,"file"], function(x) grep('.*ID$', colnames(get(x)), value=TRUE))
names(IDvars) <- LahmanData[,"file"]
str(IDvars)
# vector of unique ID variables
unique(unlist(IDvars))

# which datasets have playerID?
names(which(sapply(IDvars, function(x) "playerID" %in% x)))

################################################
# Visualize relations among datasets via an MDS
################################################
# jaccard distance between two sets; assure positivity
jaccard <- function(A, B) {
max(1 - length(intersect(A,B)) / length(union(A,B)), .00001)
}

distmat <- function(vars, FUN=jaccard) {

`Managers` *Managers table*

Description

Managers table: information about individual team managers, teams they managed and some basic statistics for those teams in each year.

Usage

```
data(Managers)
```

Format

A data frame with 3718 observations on the following 10 variables.

`playerID` Manager (player) ID code

`yearID` Year

`teamID` Team; a factor

`lgID` League; a factor with levels `AA` `AL` `FL` `NL` `PL` `UA`

`inseason` Managerial order. Zero if the individual managed the team the entire year. Otherwise denotes where the manager appeared in the managerial order (1 for first manager, 2 for second, etc.)

`G` Games managed

`W` Wins

`L` Losses

`rank` Team's final position in standings that year

`plyrMgr` Player Manager (denoted by 'Y'); a factor with levels `N` `Y`

`ManagersHalf` *ManagersHalf table*

Description

Split season data for managers

Usage

```
data(ManagersHalf)
```

Format

A data frame with 93 observations on the following 10 variables.

`playerID` Manager (player) ID code

`yearID` Year

`teamID` Team; a factor

`lgID` League; a factor with levels `AL` `NL`

`inseason` Managerial order. One if the individual managed the team the entire year. Otherwise denotes where the manager appeared in the managerial order (1 for first manager, 2 for second, etc.). A factor with levels `1` `2` `3` `4` `5`

`half` First or second half of season

`G` Games managed

`W` Wins

`L` Losses

`rank` Team's position in standings for the half

Source

Lahman, S. (2023) Lahman's Baseball Database, 1871-2022, 2022 version, https://www.seanlahman.com/baseball-archive/statistics/

Examples

```
library("dplyr")
library("reshape2")

# Only have data for 1892 and 1981

# League rank by half for 1981 teams with the same
# manager in both halves who were hired in-season
ManagersHalf %>%
  filter(yearID >= 1901) %>%
  group_by(teamID, yearID) %>%
  filter(all(playerID == playerID[1])) %>%  # same manager in both halves
  mutate(winPct = round(W/G, 3)) %>%
  reshape2::dcast(playerID + yearID + teamID + lgID ~ half,
                  value.var = "rank") %>%
  rename(rank1 = `1`, rank2 = `2`)
```

Parks *Parks table*

Description

Name and location data for baseball stadiums.

Usage

```
data(Parks)
```

Format

A data frame with 255 observations on the following 6 variables.

`park.key` unique identifier for each ballpark

`park.name` the name of the ballpark

`park.alias` a semicolon delimited list of other names for the ballpark if they exist

`city` city where the ballpark is located

`state` state where the ballpark is located

`country` country where the ballpark is located

Details

This dataset apparently includes all ballparks that were ever used in baseball. There is no indication of the years they were used, nor the teams that played there.

The ballparks can be associated with teams through the `park` variable in the `Teams` table.

Teams

Examples

```
data(Parks)
library(dplyr)
# how many parks in each country?
table(Parks$country)

# how many parks in each US state?
Parks %>%
  filter(country=="US") %>%
  count(state, sort=TRUE)

# ballparks in NYC
Parks %>%
  filter(state=="NY") %>%
  filter(city %in% c("New York", "Brooklyn", "Queens"))

# ballparks in Canada
Parks %>%
  filter(country=="CA") %>%
  count(state, sort=TRUE)

# what are the Canadian parks?
Parks %>%
  dplyr::filter(country=="CA")
```

People *People table*

Description

People table - Player names, DOB, and biographical info. This file is to be used to get details about players listed in the Batting, Pitching, and other files where players are identified only by playerID.

Usage

```
data(People)
```

Format

A data frame with 20370 observations on the following 26 variables.

`playerID` A unique code assigned to each player. The `playerID` links the data in this file with records on players in the other files.

`birthYear` Year player was born

`birthMonth` Month player was born

`birthDay` Day player was born

`birthCountry` Country where player was born

`birthState` State where player was born

`birthCity` City where player was born

`deathYear` Year player died

`deathMonth` Month player died

`deathDay` Day player died

`deathCountry` Country where player died

`deathState` State where player died

`deathCity` City where player died

`nameFirst` Player's first name

`nameLast` Player's last name

`nameGiven` Player's given name (typically first and middle)

`weight` Player's weight in pounds

`height` Player's height in inches

`bats` a factor: Player's batting hand (left (L), right (R), or both (B))

`throws` a factor: Player's throwing hand (left(L) or right(R))

`debut` Date that player made first major league appearance

`finalGame` Date that player made first major league appearance (blank if still active)

`retroID` ID used by retrosheet, https://www.retrosheet.org/

`bbrefID` ID used by Baseball Reference website, https://www.baseball-reference.com/

`birthDate` Player's birthdate, in `as.Date` format

`deathDate` Player's deathdate, in `as.Date` format

Details

`debut`, `finalGame` were converted from character strings with `as.Date`.

```

Pitching *Pitching table*

Description

Pitching table

Usage

```
data(Pitching)
```

Format

A data frame with 50402 observations on the following 30 variables.

`playerID` Player ID code

`yearID` Year

`stint` player's stint (order of appearances within a season)

`teamID` Team; a factor

`lgID` League; a factor with levels `AA` `AL` `FL` `NL` `PL` `UA`

`W` Wins

`L` Losses

`G` Games

`GS` Games Started

`CG` Complete Games

`SHO` Shutouts

`SV` Saves

`IPouts` Outs Pitched (innings pitched x 3)

`H` Hits

`ER` Earned Runs

`HR` Homeruns

`BB` Walks

`SO` Strikeouts

`BAOpp` Opponent's Batting Average

`ERA` Earned Run Average

`IBB` Intentional Walks

`WP` Wild Pitches

`HBP` Batters Hit By Pitch

`BK` Balks

`BFP` Batters faced by Pitcher

`GF` Games Finished

`R` Runs Allowed

`SH` Sacrifices by opposing batters

`SF` Sacrifice flies by opposing batters

`GIDP` Grounded into double plays by opposing batter

`playerInfo` *Lookup Information for Players and Teams*

Description

These functions use `grep` to lookup information about players (from the `People` file) and teams (from the `Teams` file).

Usage

```
playerInfo(playerID, nameFirst, nameLast, data = Lahman::People, extra = NULL, ...)

teamInfo(teamID, name, data = Lahman::Teams, extra = NULL, ...)
```

Arguments

`playerID`	pattern for `playerID`
`nameFirst`	pattern for first name
`nameLast`	pattern for last name
`data`	The name of the dataset to search
`extra`	A character vector of other fields to include in the result
`...`	other arguments passed to `grep`
`teamID`	pattern for `teamID`
`name`	pattern for team name

Value

Returns a data frame for unique matching rows from `data`

Author(s)

Michael Friendly

  teamInfo("CH", extra="park")
```

`Salaries` *Salaries table*

Description

Player salary data.

Usage

```
data(Salaries)
```

Format

A data frame with 26428 observations on the following 5 variables.

`yearID` Year

`teamID` Team; a factor

`lgID` League; a factor

`playerID` Player ID code

`salary` Salary

Details

There is no real coverage of player's salaries until 1985.

```

`Schools` *Schools table*

Description

Information on schools players attended, by school

Usage

```
data(Schools)
```

Format

A data frame with 1207 observations on the following 5 variables.

`schoolID` school ID code

`name_full` school name

`city` city where school is located

`state` state where school's city is located

`country` country where school is located

Source

Lahman, S. (2023) Lahman's Baseball Database, 1871-2022, 2022 version, https://www.seanlahman.com/baseball-archive/statistics/

Examples

```
require("dplyr")

# How many different schools are listed in each state?
table(Schools$state)

# How many different schools are listed in each country?
table(Schools$country)

# Top 20 schools
schoolInfo <- Schools %>% select(-country)

schoolCount <- CollegePlaying %>%
                 group_by(schoolID) %>%
                 summarise(players = length(schoolID)) %>%
                 left_join(schoolInfo, by = "schoolID") %>%
                 arrange(desc(players))
head(schoolCount, 20)

# sum counts by state
schoolStates <- schoolCount %>%
                  group_by(state) %>%
                  summarise(players = sum(players),
                            schools = length(state))
str(schoolStates)
summary(schoolStates)
```

`SeriesPost` *SeriesPost table*

Description

Post season series information

Usage

```
data(SeriesPost)
```

Format

A data frame with 378 observations on the following 9 variables.

`yearID` Year

`round` Level of playoffs

`teamIDwinner` Team ID of the team that won the series; a factor

`lgIDwinner` League ID of the team that won the series; a factor with levels `AL` `NL`

`teamIDloser` Team ID of the team that lost the series; a factor

`lgIDloser` League ID of the team that lost the series; a factor with levels `AL` `NL`

`wins` Wins by team that won the series

`losses` Losses by team that won the series

`ties` Tie games

Source

Lahman, S. (2021) Lahman's Baseball Database, 1871-2020, 2020 version, https://www.seanlahman.com/baseball-archive/statistics/

Examples

```
data(SeriesPost)

# How many times has each team won the World Series?

# Notes:
# - the SeriesPost table includes an identifier for the
# team (teamID), but not the franchise (e.g. the Brooklyn Dodgers
# [BRO] and Los Angeles Dodgers [LAN] are counted separately)
#
# - the World Series was first played in 1903, but the
# Lahman data tables have the final round of the earlier
# playoffs labelled "WS", so it is necessary to
# filter the SeriesPost table to exclude years prior to 1903.

# using the dplyr data manipulation package
library("dplyr")
library("tidyr")
library("ggplot2")

## WS winners, arranged in descending order of titles won
ws_winner_table <- SeriesPost %>%
  filter(yearID > "1902", round == "WS") %>%

  select(-lgIDwinner, -lgIDloser) %>%
  arrange(yearID, round)
```

`Teams` *Teams table*

Description

Yearly statistics and standings for teams

Usage

```
data(Teams)
```

Format

A data frame with 3015 observations on the following 48 variables.

`yearID` Year

`lgID` League; a factor with levels `AA` `AL` `FL` `NL` `PL` `UA`

`teamID` Team; a factor

`franchID` Franchise (links to `TeamsFranchises` table)

`divID` Team's division; a factor with levels `C` `E` `W`

`Rank` Position in final standings

`G` Games played

`Ghome` Games played at home

`W` Wins

`L` Losses

`DivWin` Division Winner (Y or N)

`WCWin` Wild Card Winner (Y or N)

`LgWin` League Champion(Y or N)

`WSWin` World Series Winner (Y or N)

`R` Runs scored

`AB` At bats

`H` Hits by batters

`X2B` Doubles

`X3B` Triples

`HR` Homeruns by batters

`BB` Walks by batters

`SO` Strikeouts by batters

`SB` Stolen bases

`CS` Caught stealing

`HBP` Batters hit by pitch

`SF` Sacrifice flies

`RA` Opponents runs scored

`ER` Earned runs allowed

`ERA` Earned run average

`CG` Complete games

`SHO` Shutouts

`SV` Saves

`IPouts` Outs Pitched (innings pitched x 3)

`HA` Hits allowed

`HRA` Homeruns allowed

`BBA` Walks allowed

`SOA` Strikeouts by pitchers

`E` Errors

`DP` Double Plays

`FP` Fielding percentage

`name` Team's full name

`park` Name of team's home ballpark

`attendance` Home attendance total

`BPF` Three-year park factor for batters

`PPF` Three-year park factor for pitchers

`teamIDBR` Team ID used by Baseball Reference website

`teamIDlahman45` Team ID used in Lahman database version 4.5

`teamIDretro` Team ID used by Retrosheet

Details

Variables `X2B` and `X3B` are named `2B` and `3B` in the original database

TeamsFranchises *TeamFranchises table*

Description

Information about team franchises

Usage

```
data(TeamsFranchises)
```

Format

A data frame with 120 observations on the following 4 variables.

`franchID` Franchise ID; a factor

`franchName` Franchise name

`active` Whether team is currently active (Y or N)

`NAassoc` ID of National Association team franchise played as

Source

Lahman, S. (2021) Lahman's Baseball Database, 1871-2020, 2020 version, https://www.seanlahman.com/baseball-archive/statistics/

Examples

```
data(TeamsFranchises)

# Which of the active Major League Baseball teams had a National Association predecessor?

# Notes:
# - the National Association was founded in 1871, and continued through the
# 1875 season. In 1876, six clubs from the National Association and two other
# independent clubs formed the National League, which exists to this day.
# - the `active` field has "NA" for the National Association franchises
# - where appropriate, the `NAassoc` field has the `franchID` of the successor National League team

# using the dplyr data manipulation package
library("dplyr")

NatAssoc_active_table <- TeamsFranchises %>%
  filter(active == "Y") %>%
  filter(!is.na(NAassoc))
NatAssoc_active_table

# Merge current team IDs with franchise IDs
currentTeams <- Teams %>%
                  filter(yearID == 2014) %>%
```

```
                  select(teamID, franchID, lgID, park)

# Merge TeamsFranchises with currentTeams
TeamsFranchises %>%
    filter(active == "Y") %>%
    select(-active, -NAassoc) %>%
    left_join(currentTeams, by = "franchID")
```

`TeamsHalf` *TeamsHalf table*

Description

Split season data for teams

Usage

```
data(TeamsHalf)
```

Format

A data frame with 52 observations on the following 10 variables.

`yearID` Year

`lgID` League; a factor with levels `AL` `NL`

`teamID` Team; a factor

`Half` First or second half of season

`divID` Division

`DivWin` Won Division (Y or N)

`Rank` Team's position in standings for the half

`G` Games played

`W` Wins

`L` Losses

Source
